Generate noise.

Filter noise in mysterious ways... using comb filter and by adjusting phase with cycle~ input. Also pan between left and right channels.

Each of three types of noise manipulation may be triggered with independent toggles. Also one toggle to trigger all toggles.

# [mousesends]

Send out mouse state.

Inlet--

Bang to toggle metro which bangs MouseState.

Sends--

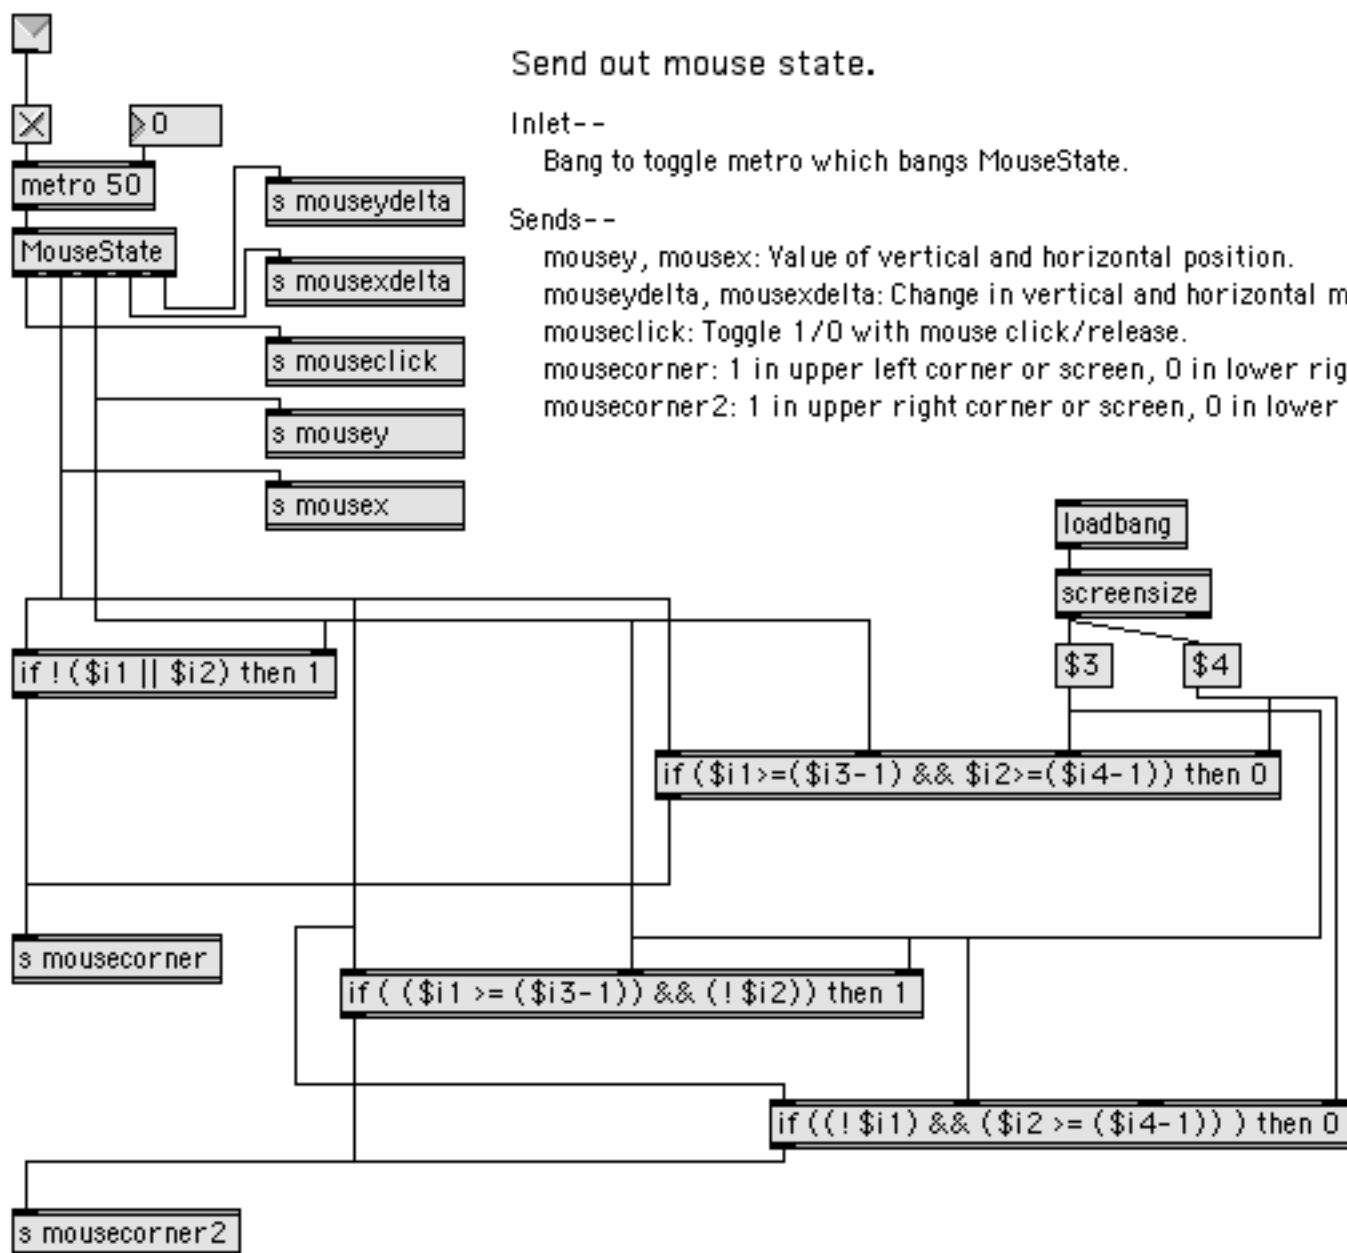

mousey, mousex: Value of vertical and horizontal position.

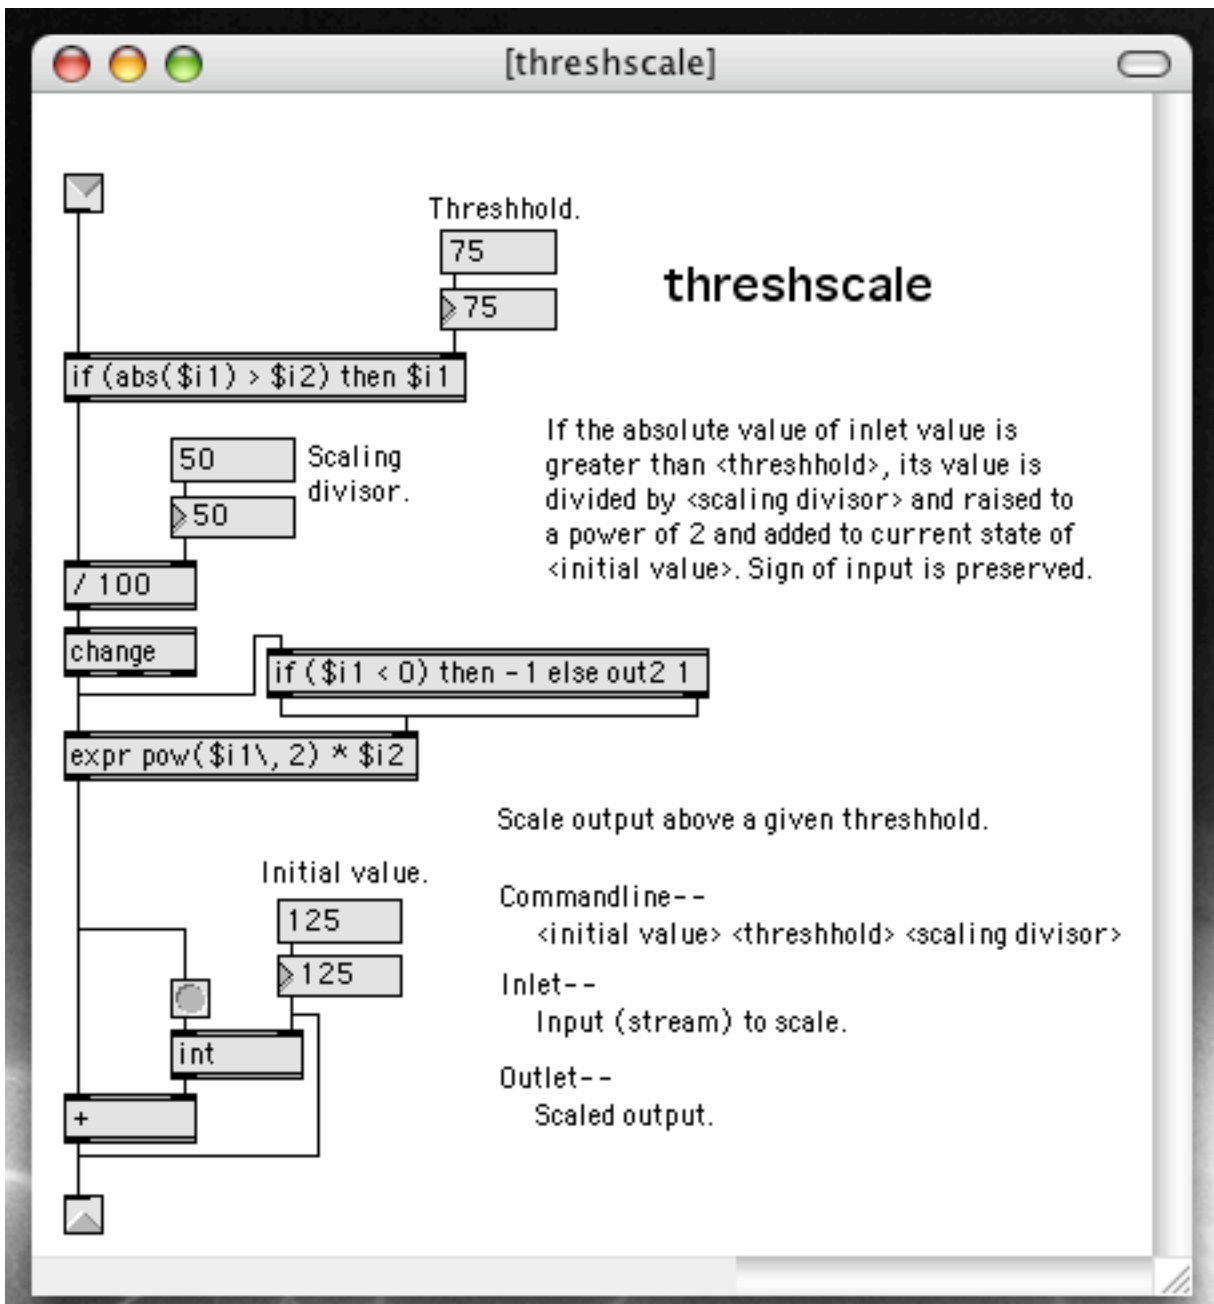

mouseydelta, mousexdelta: Change in vertical and horizontal movement.

mouseclick: Toggle 1/0 with mouse click/release.

mousecorner: 1 in upper left corner or screen, 0 in lower right.

mousecorner2: 1 in upper right corner or screen, 0 in lower left.

# S O R R U G I S

## General controls--

Spacebar to start and stop all audio.

Gain control in lower left.

Green highlighting indicate user input options. Blue indicates locations for mouse feedback.

(Search main patch and subpatches for additional controls not listed on this page.)

## Pitch and modulator controls--

Initial values of seven pitches tuned to seven notes of diatonic C scale.

Each pitch may be PLAYED WITH THE NUMBER KEYS 1-7.

Each pitch may be adjusted up or down by a pre-determined INCREMENT USING TWO LETTER KEYS immediately below the number keys.

Each pitch has a SUSTAIN TOGGLE under the pitch increment keys.

Hold down the SHIFT KEY to make the same adjustments to the MODULATOR PITCHES.

Indicators on right side report current pitches and whether sustain is toggled. Primary pitches are maroon, modulators are black.

Use square brackets to increase/decrease pitch increment (applies to both primary and modulator pitches).

Use semicolon and comma keys to increase/decrease pitch length.

Use period and slash to increase/decrease pitch delay.

Click message boxes to reset select instrument default settings.

## Sequencer controls--

Start/stop sequencer with zero (0) key, or place mouse in upper left (on) or lower right (off) corner. (Watch blue toggle for feedback.)

Quick mouse movements to the right or left will slow down or speed up the sequencer. (Watch blue number counter for feedback.)

Double-click the pitch\_sequence table to draw which pitches are to be played. Slot zero (0) indicates a rest.

Determine how much of the table is read, and which direction, by adjusting green highlighted fields. (See "modulus of table size.")

## Noise pad controls--

Click and drag vertically to change volume. Quick movements begin quick continuous changes, slow movements cause gradual change.

Toggle all noise cycling and panning by placing mouse in upper right (on) or lower left (off).

Sorrugis provides an octave of sine wave pitches each with its own modulator input. Pitches may be incremented or decremented, played singly or sustained, lengthened or shortened, or played through an adjustable delay.

Sorrugis provides a programmable "sequencer" for the pitches regardless of pitch settings. Playback may be toggled on and off, speed of playback is controlled by the mouse.

Sorrugis provides a noise pad, generated from various cyclical filters and panning. Volume controlled by the mouse.
