Arduino Programming Part 6: LCD Panel Output

EAS 199B, Winter 2013

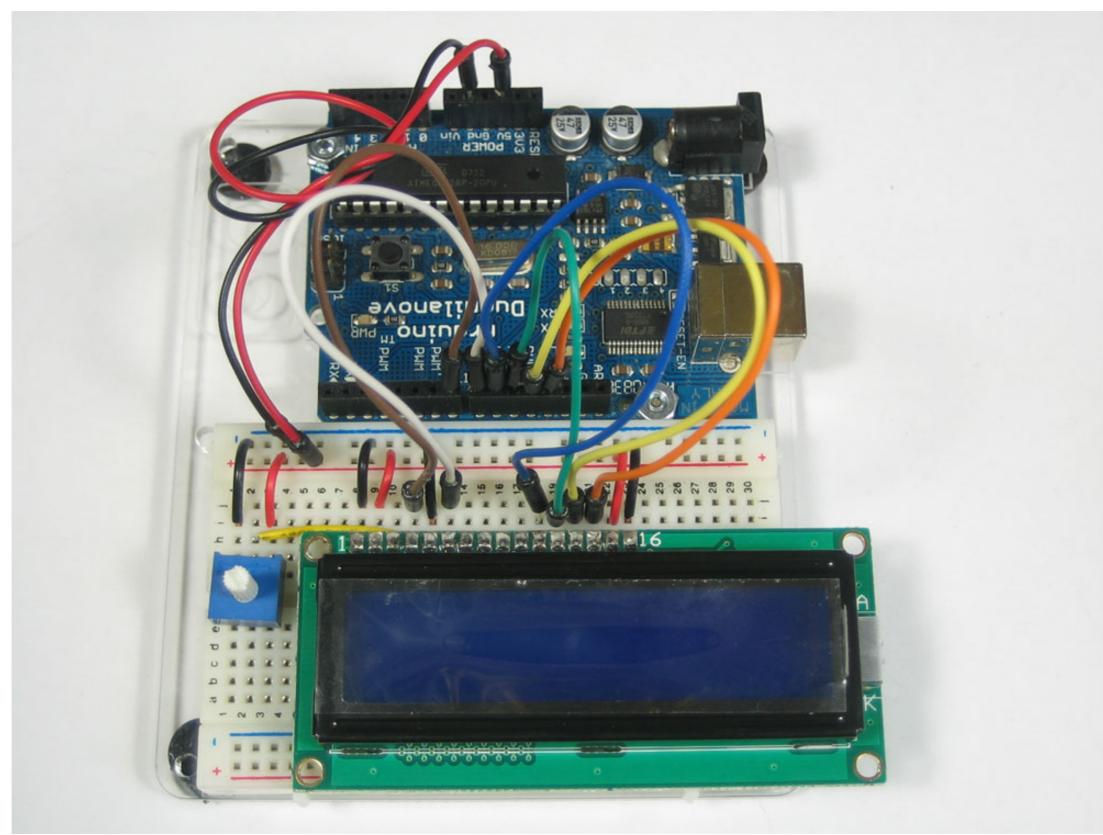

Gerald Recktenwald Portland State University gerry@me.pdx.edu

Goals

Use the 20x4 character LCD display for output

- Overview of assembly detailed instructions on the web
 - http://web.cecs.pdx.edu/~eas199/B/howto/LCDwiring/
 - http://www.ladyada.net/learn/lcd/charlcd.html
- Introduction to the LCD library
 - http://www.arduino.cc/en/Tutorial/LiquidCrystal
- Simple demonstration
- Map the 20x4 character display for fish tank data

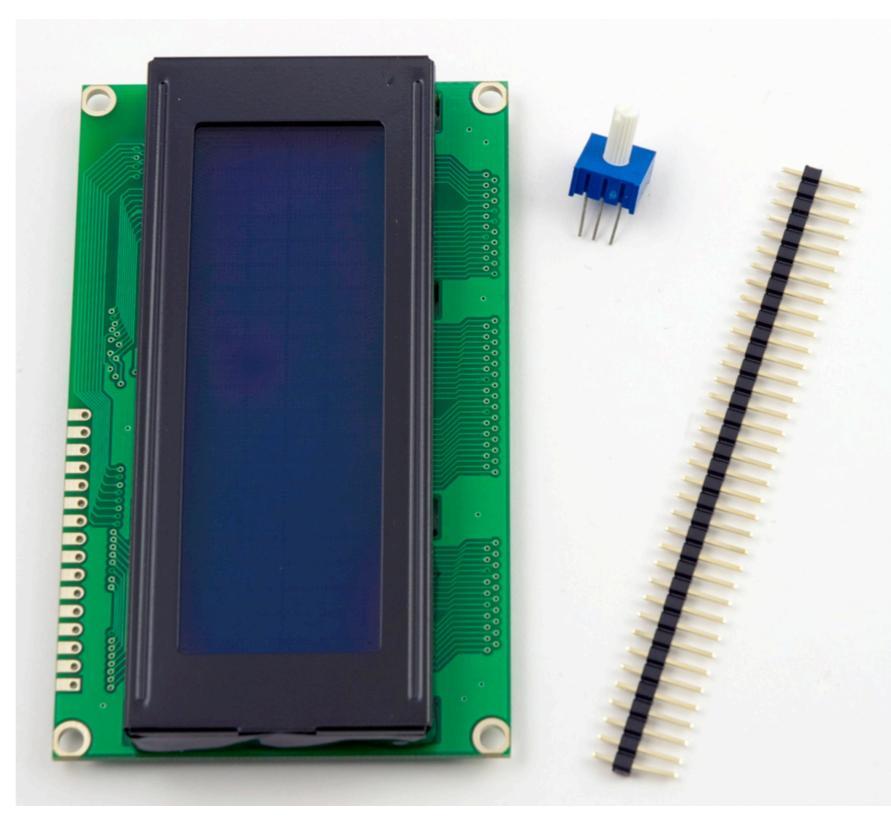

Breadboard connection via Adafruit Tutorial

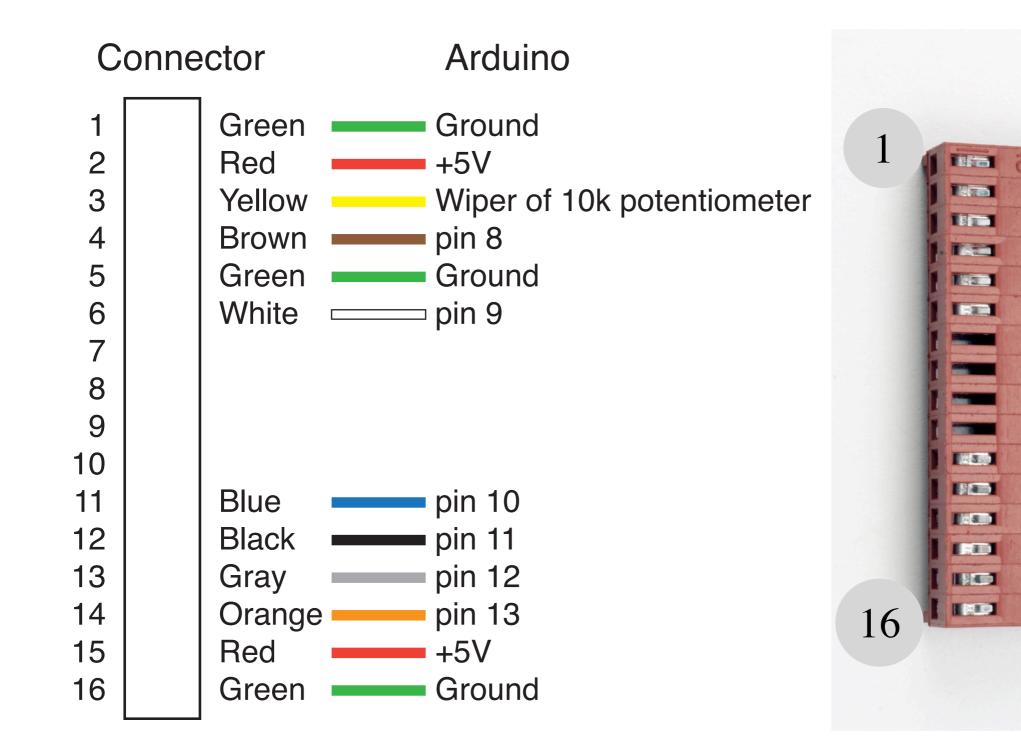

http://www.ladyada.net/learn/lcd/charlcd.html

The Adafruit kit

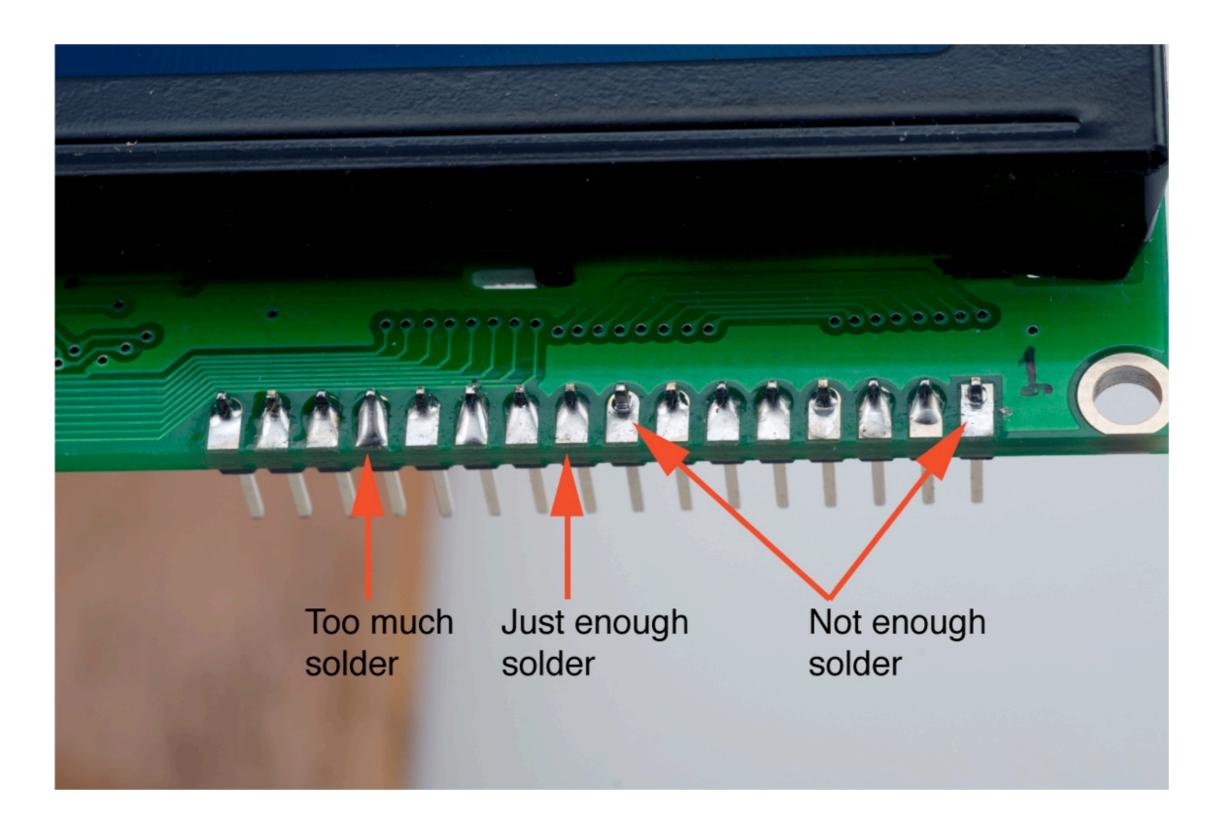

- Header for electrical connections
- 2. Potentiometer for contrast adjustment
- 3. Panel on PCB

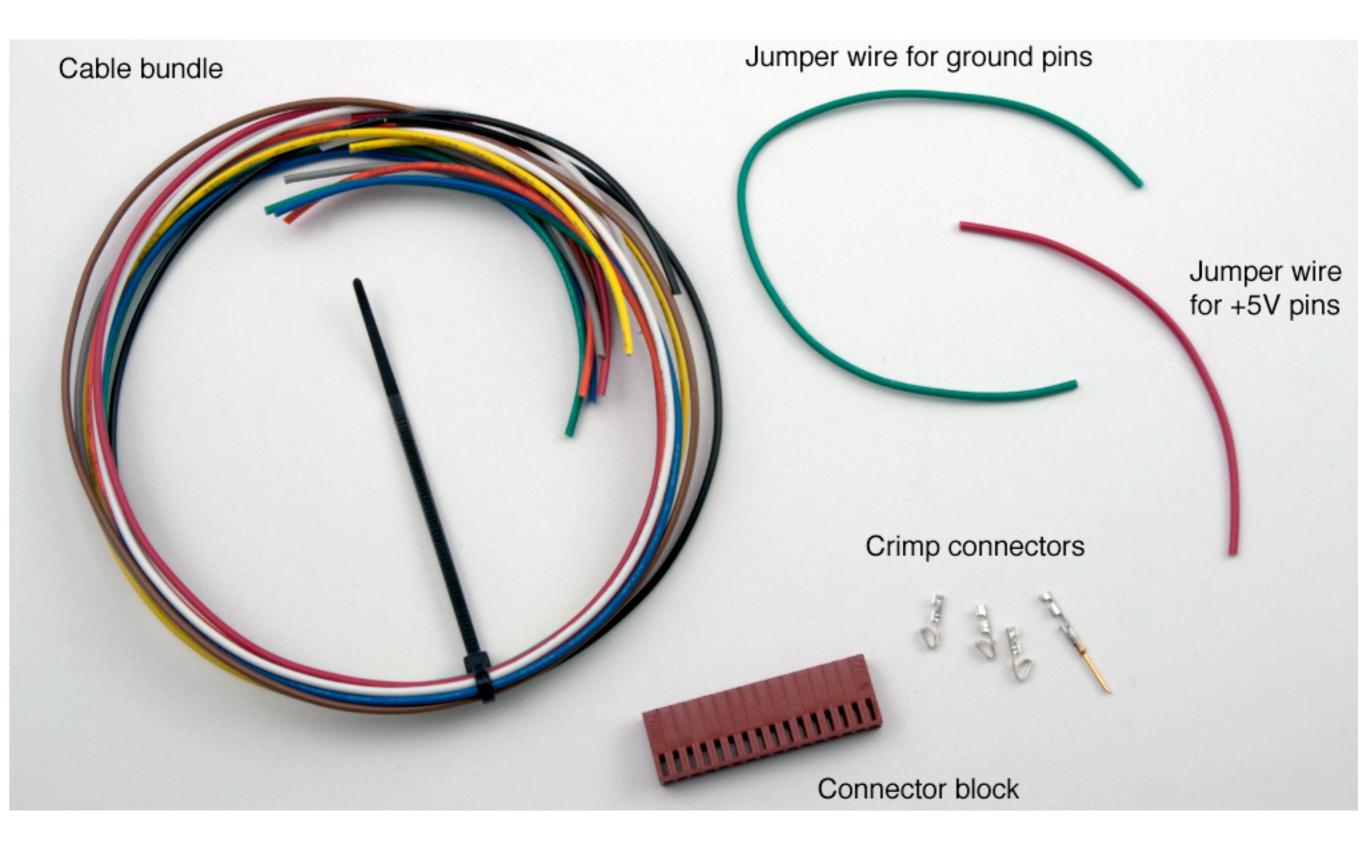

Wiring diagram

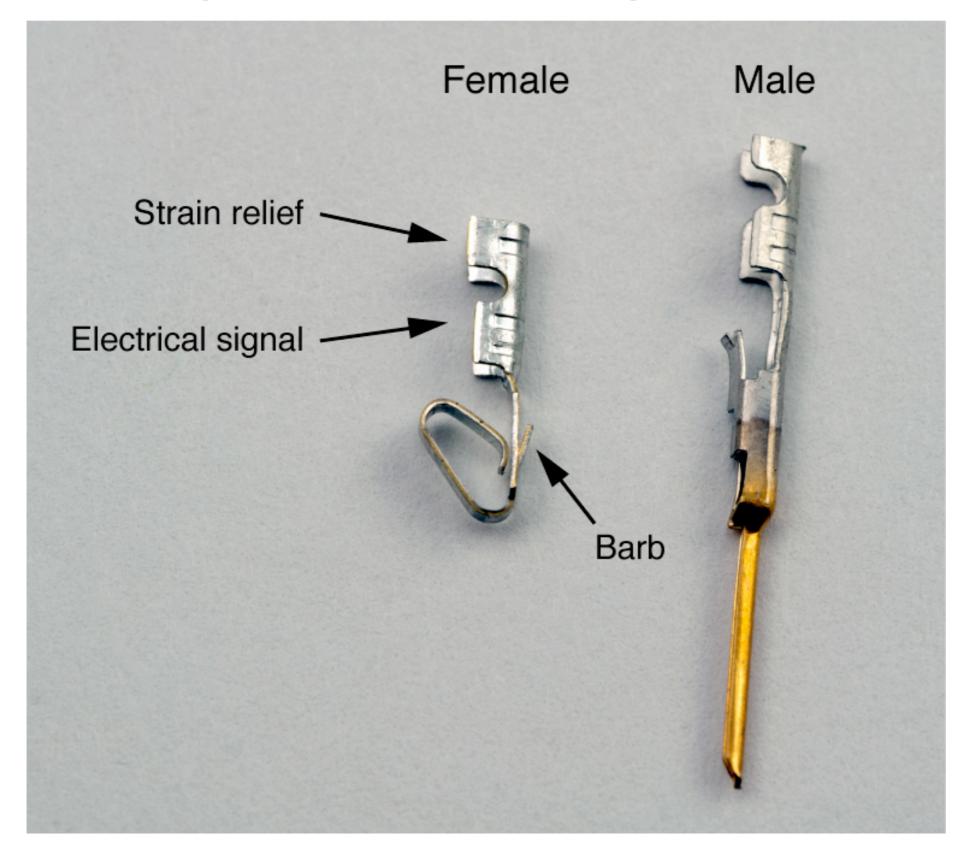

Step I: Solder the header

Step 2: Assemble the wiring harness

Crimp Connectors: they are small!

Crimp connectors are small

Don't bother with the male connectors

- They are fragile when not enclosed in a connector shell
- Just tin the stranded wire

Please be careful

- Connectors are not free
- Some failed connections are inevitable

Crimp connectors are small

Don't bother with the male connectors

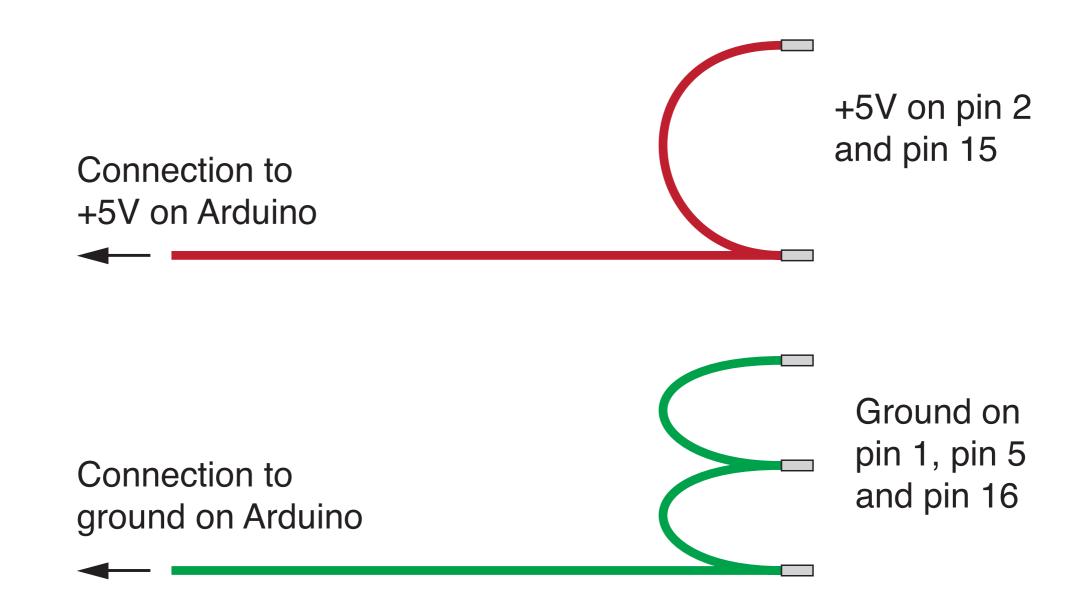

- They are fragile when not enclosed in a connector shell
- Just tin the stranded wire

Please be careful

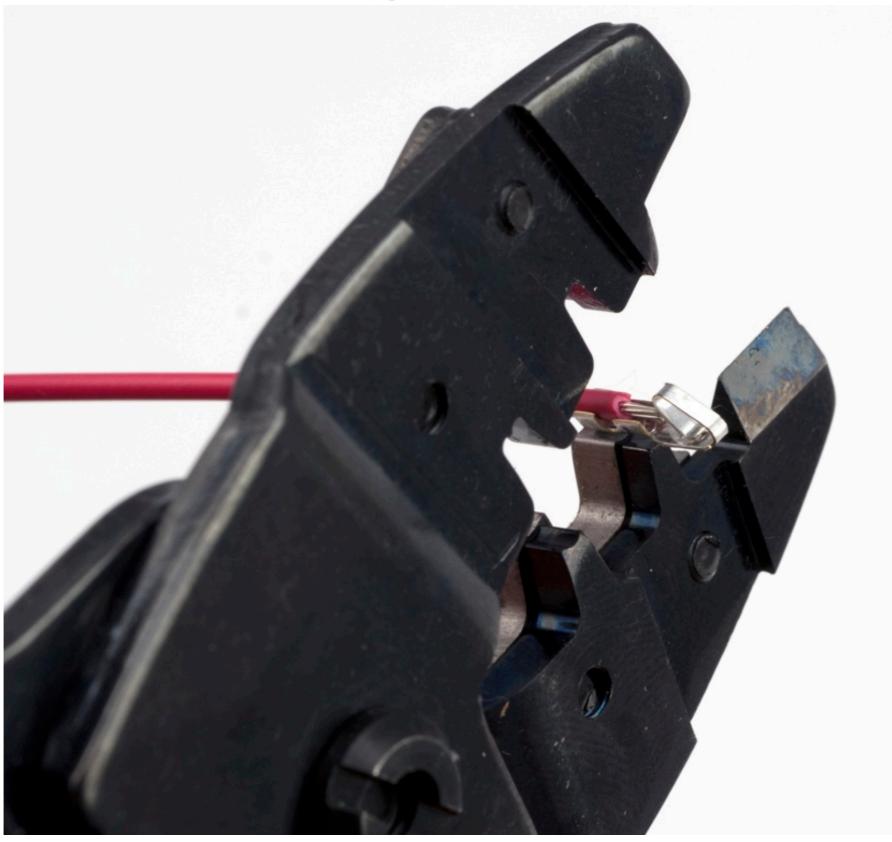

- Connectors are not free
- Some failed connections are inevitable

Do not raid kits for extra connectors! Ask your instructor for spares if you need them.

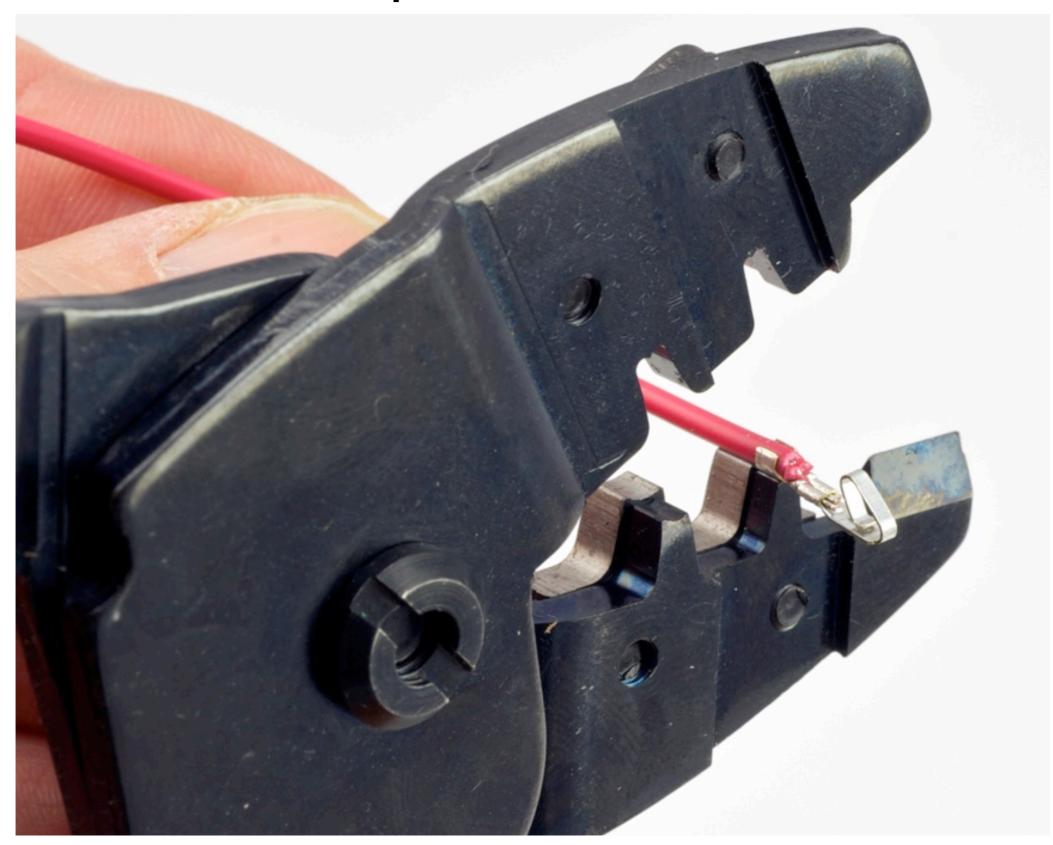

Use jumpers to avoid unnecessary wire

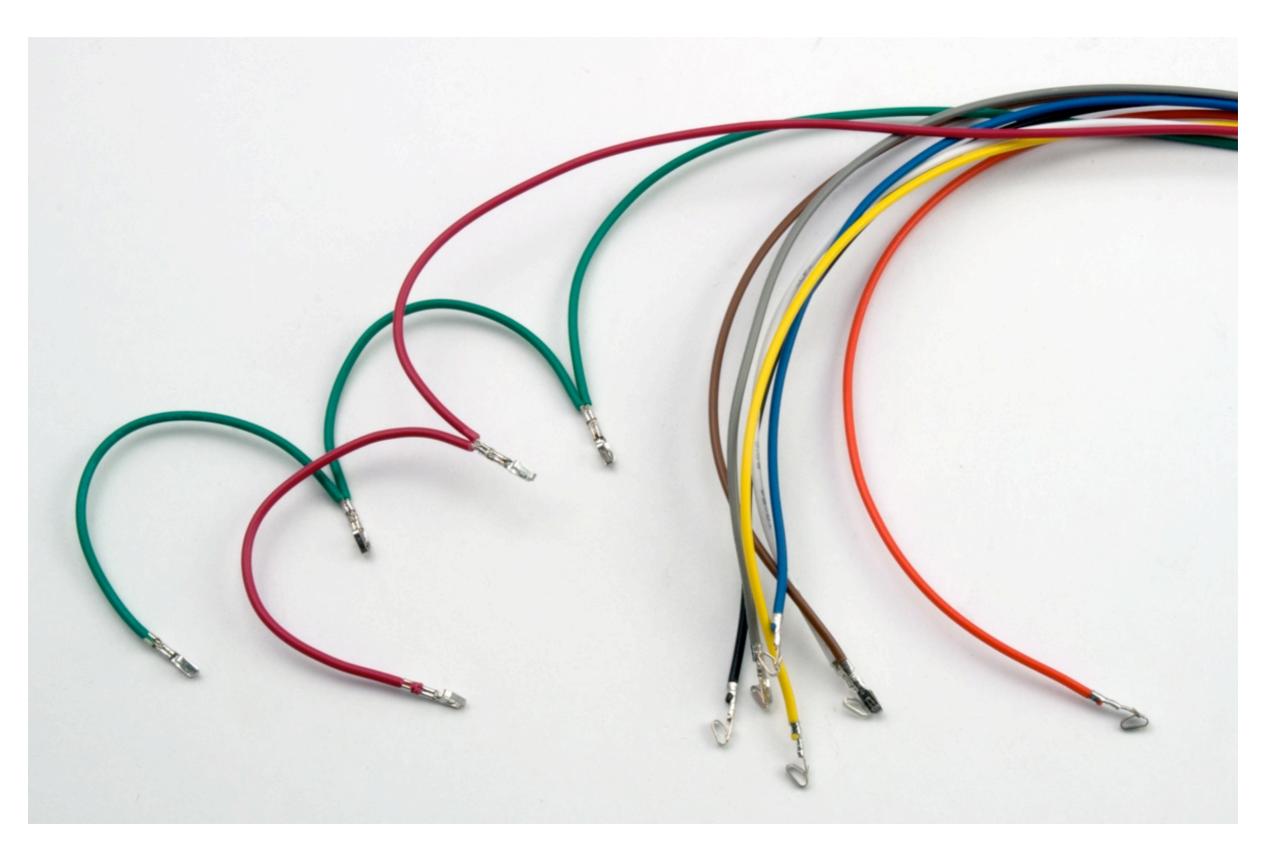

Locate the crimp connector in the tool

Crimp the strain relief

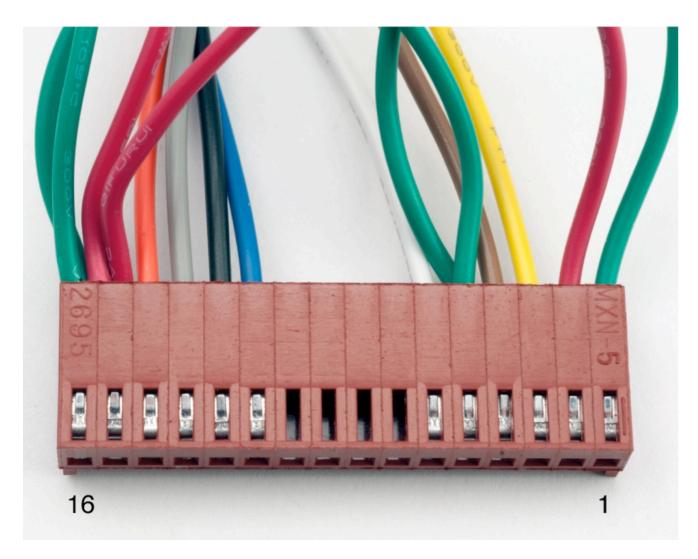

Finished crimping for the female connector

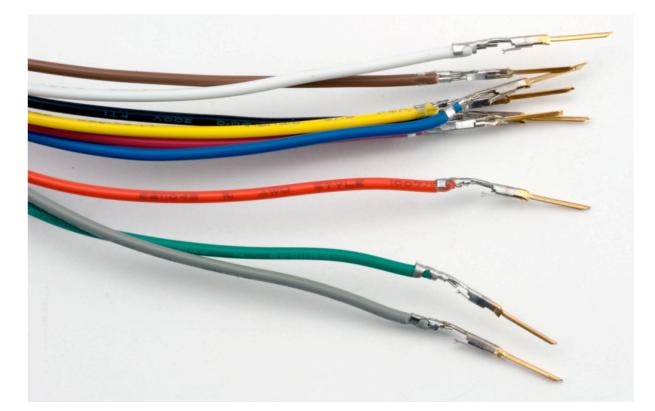

Finished female and male connectors

Female connector for LCD end

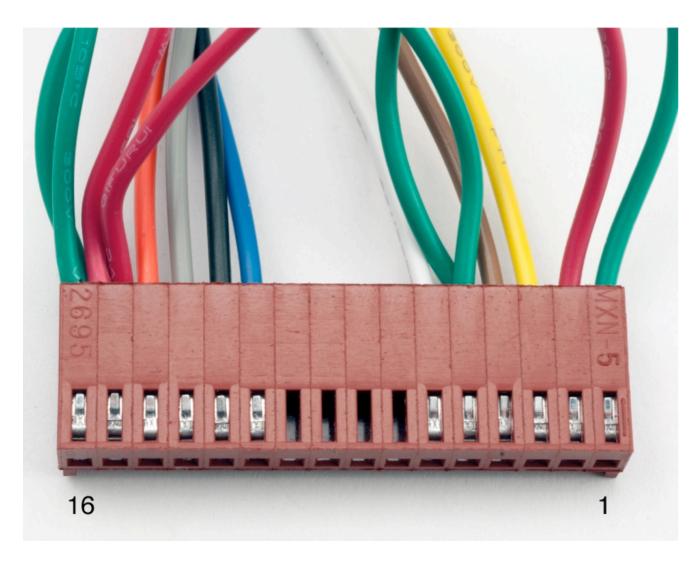

Male pins for Arduino end

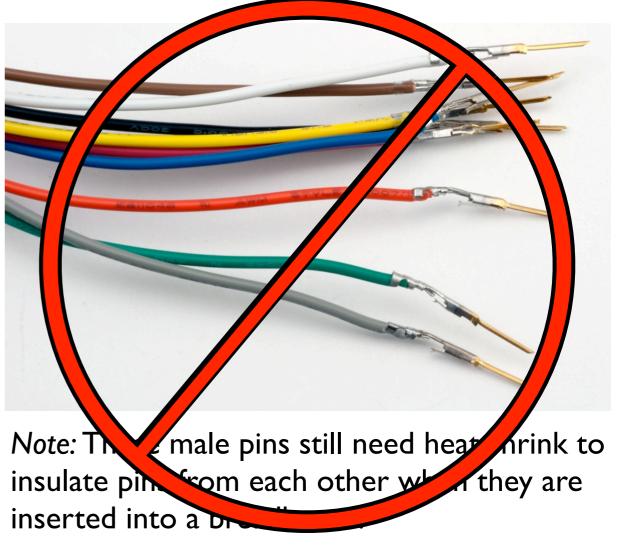

Note: These male pins still need heat shrink to insulate pins from each other when they are inserted into a breadboard.

Finished female and male connectors

Female connector for LCD end

Male pins for Arduino end

Programming Arduino for LCD Display

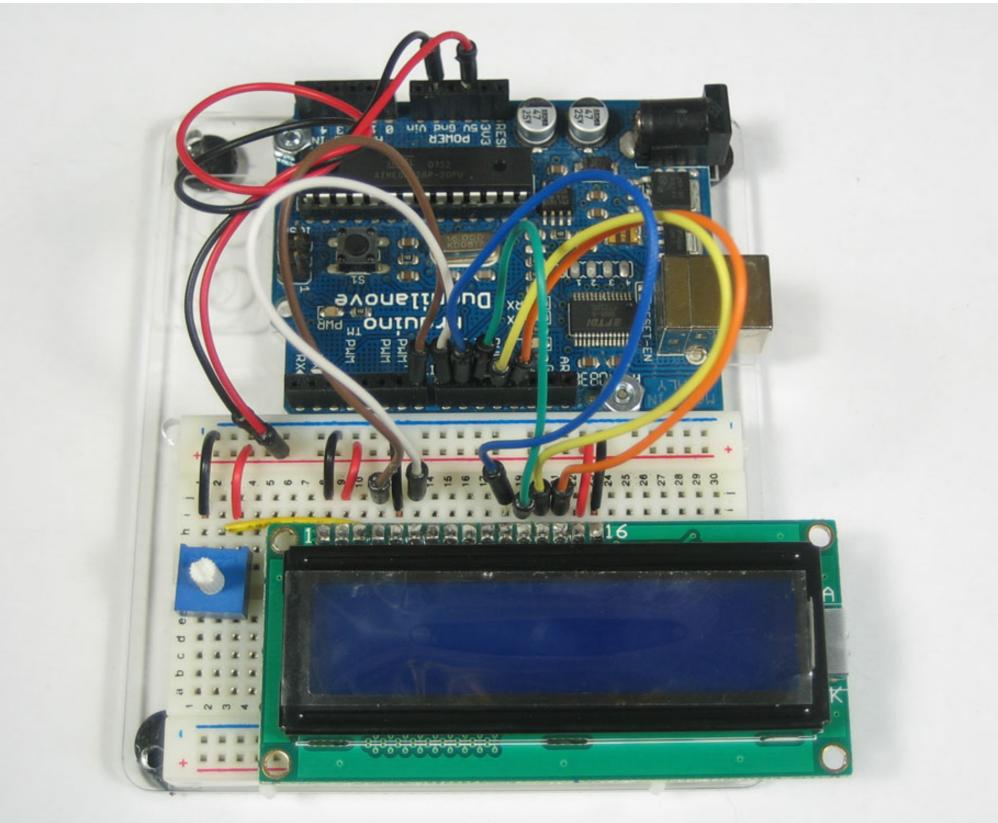

Refer to Adafruit tutorial

http://www.ladyada.net/learn/lcd/charlcd.html

and Arduino documentation

http://www.arduino.cc/en/Tutorial/LiquidCrystal

Breadboard connection via Adafruit Tutorial

Arduino Programming Part 6: EAS 199B

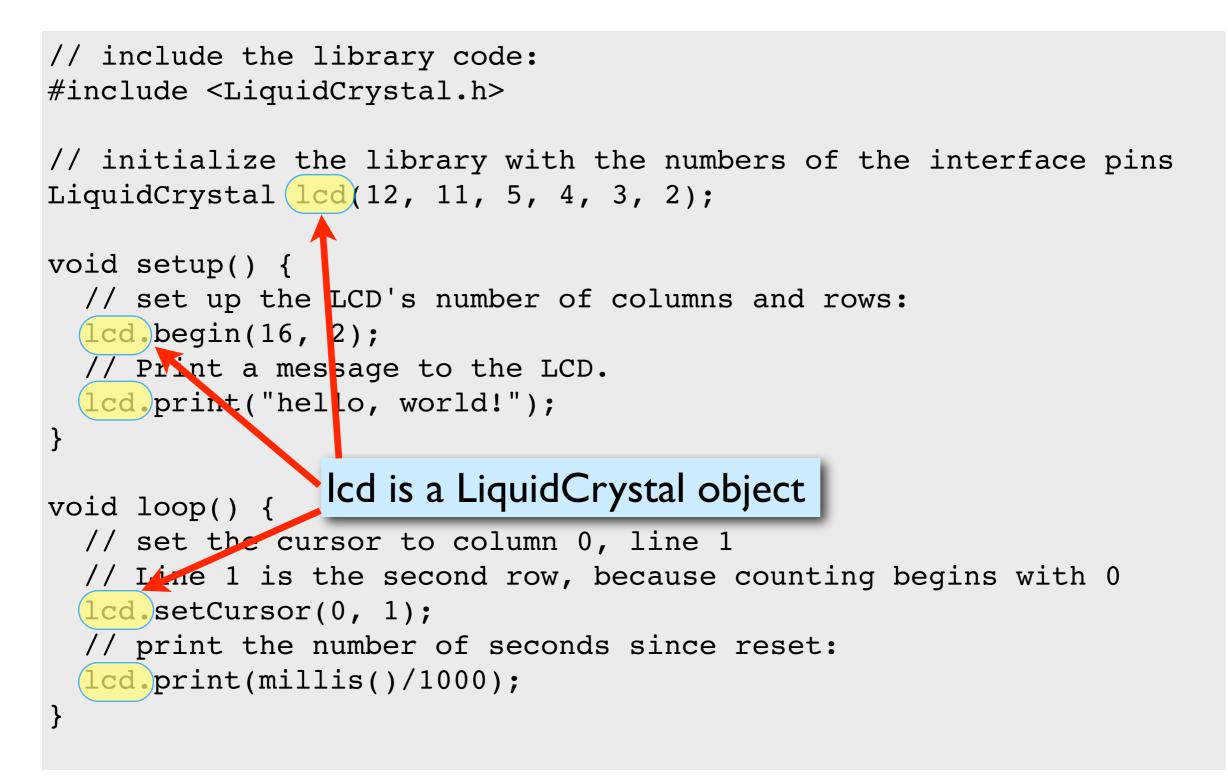

http://www.ladyada.net/learn/lcd/charlcd.html

Test the display

```
File \Rightarrow Examples \Rightarrow LiquidCrystal \Rightarrow HelloWorld
// include the library code:
#include <LiquidCrystal.h>
// initialize the library with the numbers of the interface pins
LiquidCrystal lcd(12, 11, 5, 4, 3, 2);
void setup() {
  // set up the LCD's number of columns and rows:
  lcd.begin(16, 2);
  // Print a message to the LCD.
  lcd.print("hello, world!");
}
void loop() {
  // set the cursor to column 0, line 1
  // Line 1 is the second row, because counting begins with 0
  lcd.setCursor(0, 1);
  // print the number of seconds since reset:
  lcd.print(millis()/1000);
}
```

Test the display Change pin assignments to // include the library code: match wiring harness: #include <LiquidCrystal.h> (8, 9, 10, 11, 12, 13)// initialize the library with the numbers of the interface pins LiquidCrystal lcd(12, 11, 5, 4, 3, 2); void setup() { // set up the LCD's number of columns and rows: lcd.begin(16, 2); Change to (20, 4)// Print a message to the LCD. lcd.print("hello, world!"); } void loop() { // set the cursor to column 0, line 1 // Line 1 is the second row, because counting begins with 0 lcd.setCursor(0, 1); // print the number of seconds since reset: lcd.print(millis()/1000);

Test the display

Arduino code to write to the LCD panel

Include the LCD library

In the header: #include <LiquidCrystal.h>
 (outside and before setup)

Initialize the display by creating a LiquidCrystal object

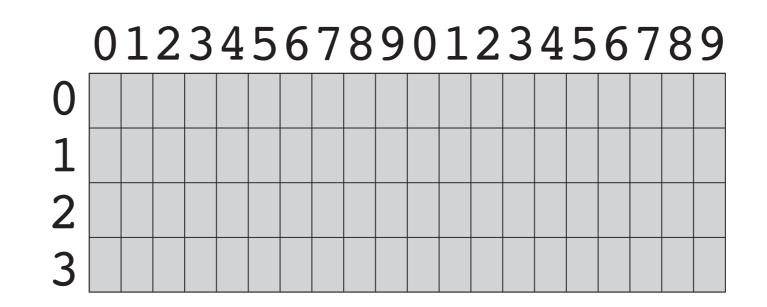

Before using the display: LiquidCrystal lcd(p1,p2,p3,p4,p5,p6); lcd.begin(20,4);

Send characters in a two-step process

| Move the cursor: | <pre>lcd.setCursor(column,row)</pre> |
|----------------------|--------------------------------------|
| Display the message: | <pre>lcd. print("message")</pre> |

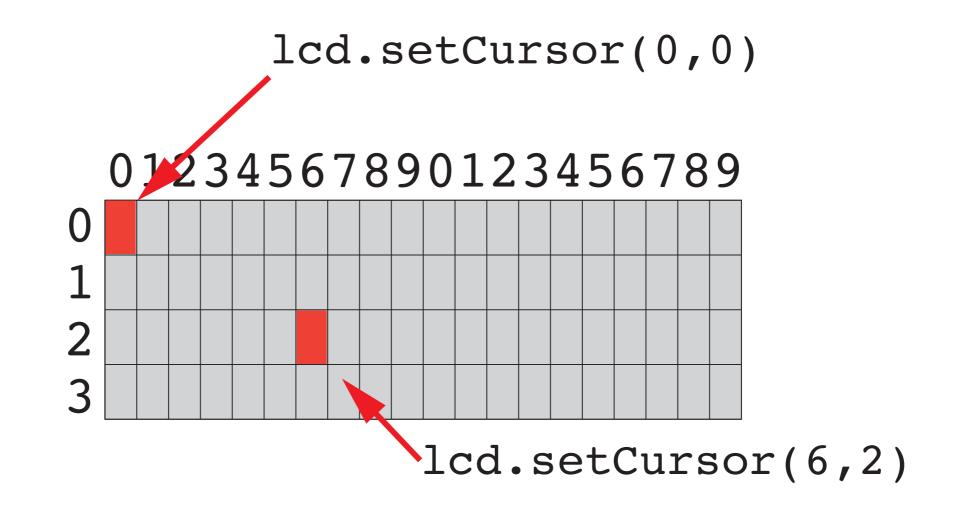

Character matrix on a 4 X 20 display

Row and column indices begin with zero

Character matrix on a 4 X 20 display

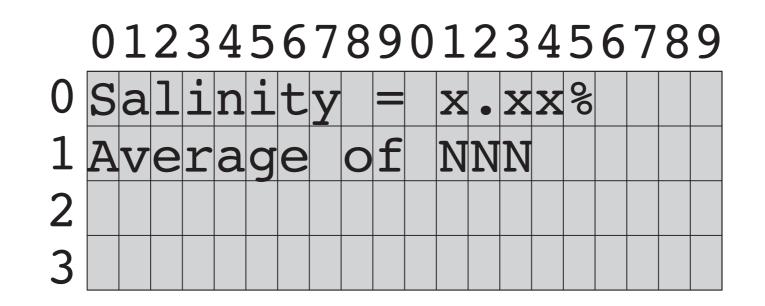

Row and column indices begin with zero

Display fish tank salinity

Modify the HelloWorld code to display the salinity

- * "Salinity = " and "Average of " can be displayed once at the start
- * x.xx and NNN values change, and are updated on the display.

Programming Paradigms

To think about styles of programming, we can organize programming languages into paradigms

| Paradigm | Representative Languages |
|--------------------------|---------------------------------|
| Procedural or Sequential | Fortran, C, Basic |
| Object-oriented | C++, smalltalk |
| Parallel /Concurrent | occam, erlang |
| Dataflow | LabVIEW |
| Functional | Haskel, Lisp |
| Scripting | perl, python |

Note that many modern program languages have features of more than one paradigm

Object-Oriented Programming (OOP)

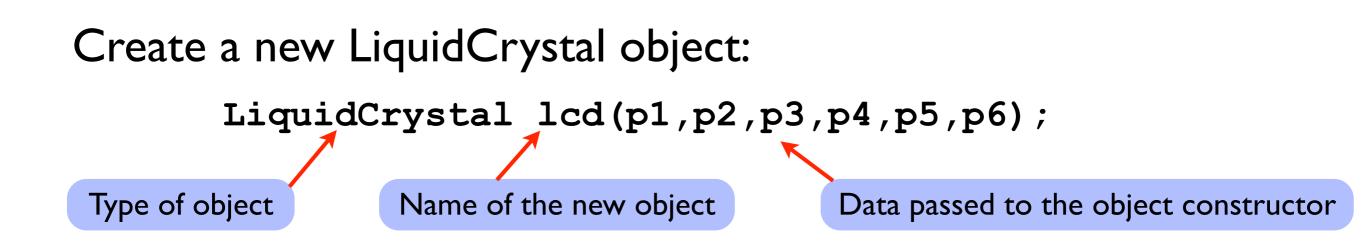

As you might expect, Objects are central to OOP

- Objects have data
- Objects have methods (like functions)
- Objects can be assembled into other objects.

Arduino Programming

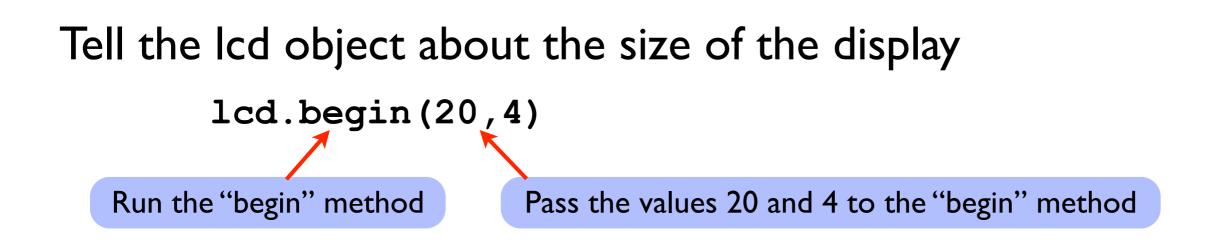

- Uses the object-oriented language C++
- Don't get carried away with the OOP on Arduino
 - Keep your Arduino programs from becoming too complex
 - Basic structure of code, with setup() and loop() is sequential
- Libraries for the Serial Monitor and LCD output use OOP
 - Know enough OOP to use existing libraries
 - OOP can be handy when programming with new types of sensors

OOP in the LCD library code

When a new object is created, the data passed to the constructor is *stored in* the object. Thus, whenever we use the variable lcd again in the program, the lcd object "knows" that it is connected to p1, p2, ..., p6.

OOP in the LCD library code

Objects have data and methods

- Data are values associated with a particular "instance" of an object
- Some data may be "public". Programmers can view or change public data.
- Some data may be "private", and therefore unavailable to programmers.
- Methods are functions that an object knows how to perform
 - Methods can return values
 - Methods can change public data
 - Methods can perform computations and interact with the environment (sensors)

OOP in the LCD library code
