

# **Machine-Level Programming III: Procedures**

**15-213: Introduction to Computer Systems  
7<sup>th</sup> Lecture, Sep. 22, 2015**

**Instructors:**

Randal E. Bryant and David R. O'Hallaron

# Mechanisms in Procedures

## ■ Passing control

- To beginning of procedure code
- Back to return point

## ■ Passing data

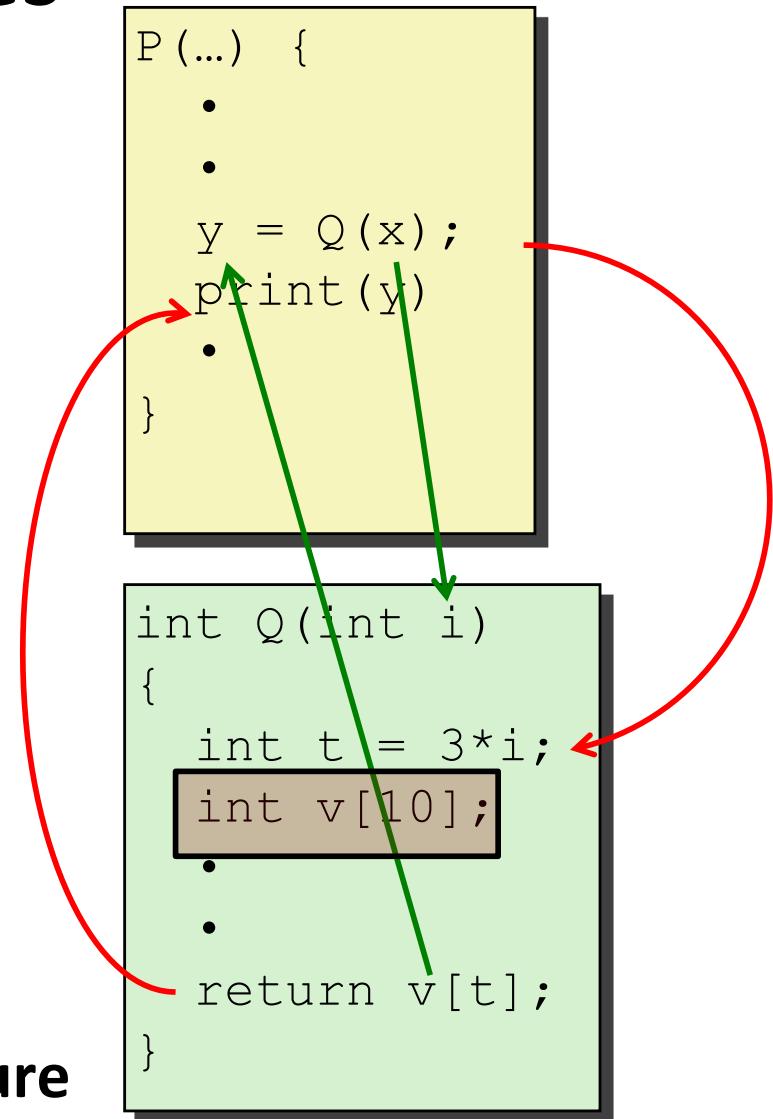

- Procedure arguments
- Return value

## ■ Memory management

- Allocate during procedure execution
- Deallocate upon return

## ■ Mechanisms all implemented with machine instructions

## ■ x86-64 implementation of a procedure uses only those mechanisms required

# Today

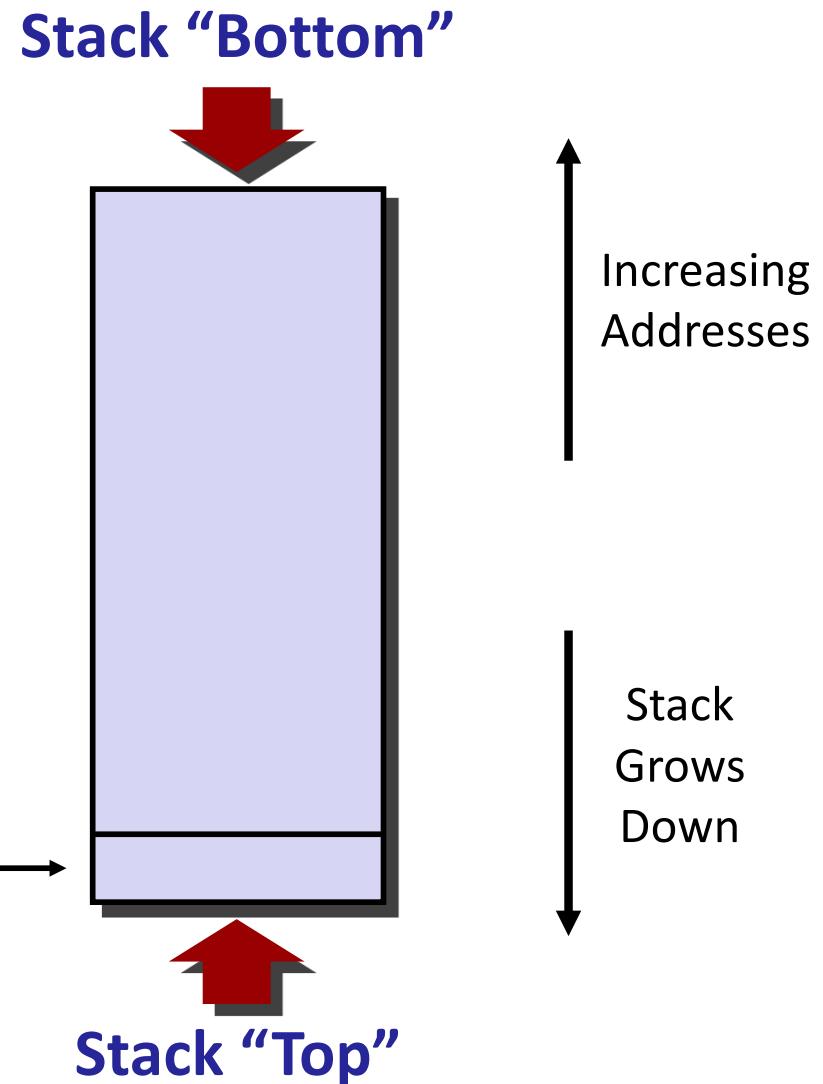

## ■ Procedures

- Stack Structure
- Calling Conventions
  - Passing control
  - Passing data
  - Managing local data
- Illustration of Recursion

# x86-64 Stack

- Region of memory managed with stack discipline
- Grows toward lower addresses
- Register `%rsp` contains lowest stack address
  - address of “top” element

Stack Pointer: `%rsp` →

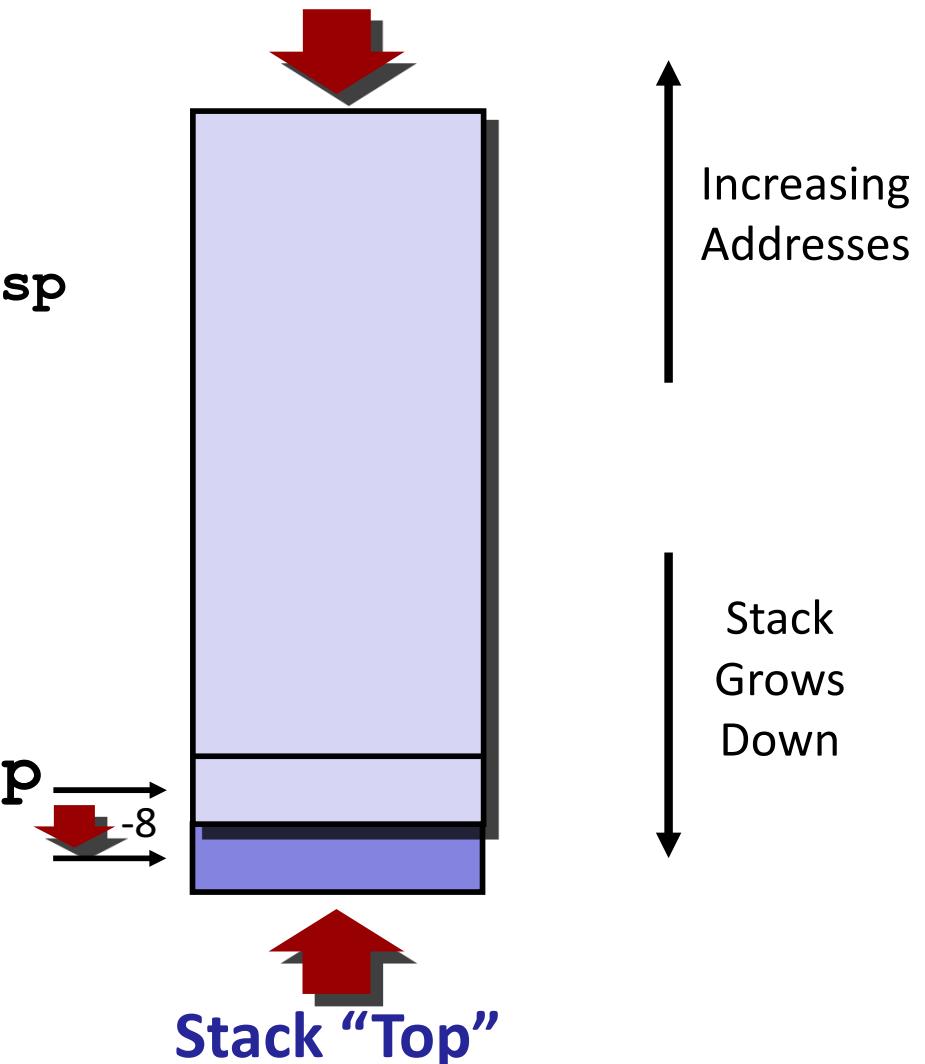

# x86-64 Stack: Push

## ■ **pushq Src**

- Fetch operand at *Src*
- Decrement **%rsp** by 8
- Write operand at address given by **%rsp**

**Stack Pointer: %rsp**

**Stack “Bottom”**

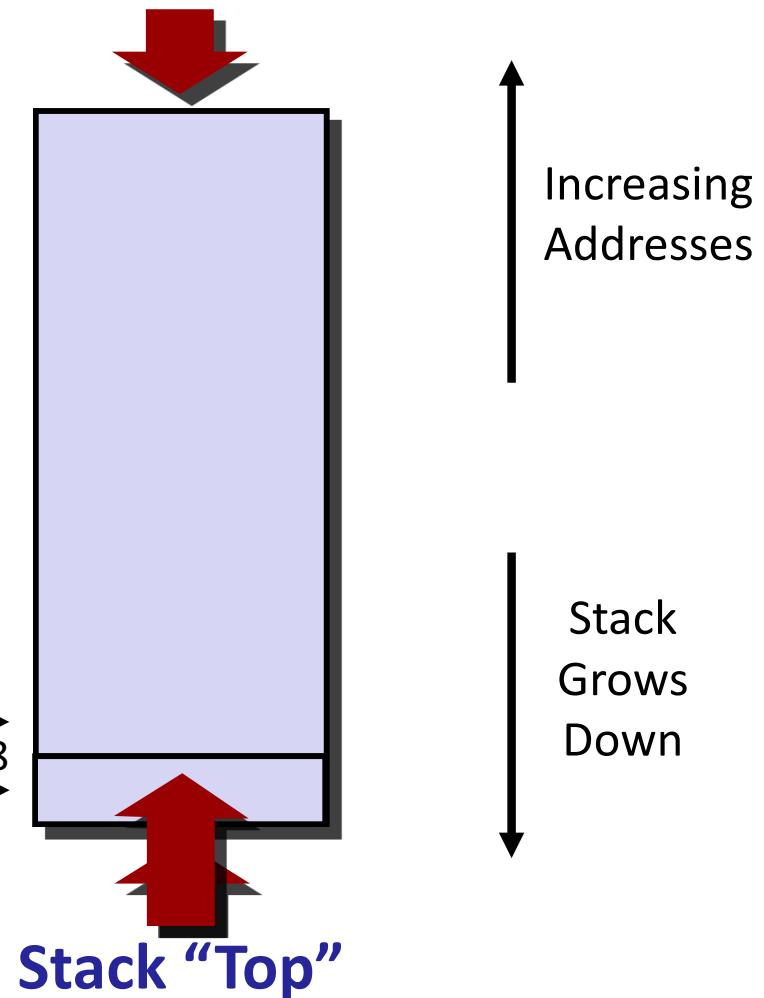

# x86-64 Stack: Pop

## ■ **popq Dest**

- Read value at address given by `%rsp`
- Increment `%rsp` by 8
- Store value at Dest (must be register)

Stack Pointer: `%rsp`

Stack “Bottom”

# Today

## ■ Procedures

- Stack Structure
- Calling Conventions
  - Passing control
  - Passing data
  - Managing local data
- Illustration of Recursion

# Code Examples

```
void multstore  
    (long x, long y, long *dest)  
{  
    long t = mult2(x, y);  
    *dest = t;  
}
```

```
0000000000400540 <multstore>:  
    400540: push    %rbx          # Save %rbx  
    400541: mov     %rdx,%rbx    # Save dest  
    400544: callq   400550 <mult2>  # mult2(x, y)  
    400549: mov     %rax,(%rbx)    # Save at dest  
    40054c: pop    %rbx          # Restore %rbx  
    40054d: retq               # Return
```

```
long mult2  
    (long a, long b)  
{  
    long s = a * b;  
    return s;  
}
```

```
0000000000400550 <mult2>:  
    400550: mov     %rdi,%rax      # a  
    400553: imul   %rsi,%rax      # a * b  
    400557: retq               # Return
```

# Procedure Control Flow

- Use stack to support procedure call and return

- **Procedure call:** `call label`

- Push return address on stack
  - Jump to *label*

- **Return address:**

- Address of the next instruction right after call
  - Example from disassembly

- **Procedure return:** `ret`

- Pop address from stack
  - Jump to address

# Control Flow Example #1

```
000000000400540 <multstore>:
```

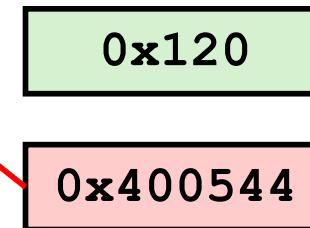

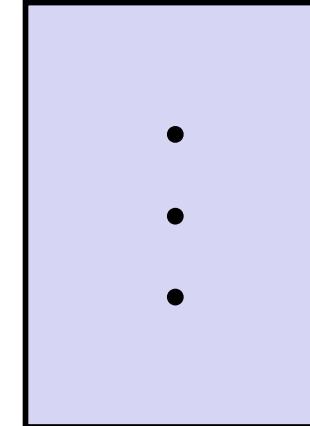

```
•  
•  
400544: callq 400550 <mult2>  
400549: mov    %rax, (%rbx)  
•  
•
```

```
000000000400550 <mult2>:
```

```
400550: mov    %rdi, %rax  
•  
•  
400557: retq

# Today

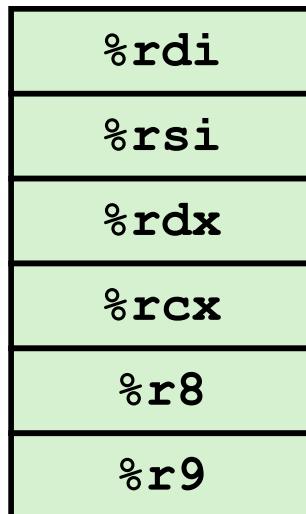

## ■ Procedures

- Stack Structure
- Calling Conventions
  - Passing control
  - Passing data
  - Managing local data
- Illustrations of Recursion & Pointers

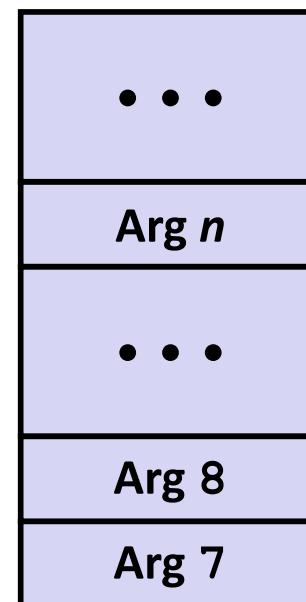

# Procedure Data Flow

## Registers

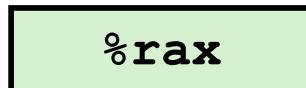

- First 6 arguments

## Stack

- Return value

- Only allocate stack space when needed

# Data Flow Examples

```
void multstore
    (long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
0000000000400540 <multstore>:
# x in %rdi, y in %rsi, dest in %rdx
...
400541: mov    %rdx,%rbx          # Save dest
400544: callq  400550 <mult2>    # mult2(x,y)
# t in %rax
400549: mov    %rax,(%rbx)       # Save at dest
...
```

```
long mult2
    (long a, long b)
{
    long s = a * b;
    return s;
}
```

```
0000000000400550 <mult2>:
# a in %rdi, b in %rsi
400550: mov    %rdi,%rax        # a
400553: imul   %rsi,%rax        # a * b
# s in %rax
400557: retq               # Return
```

# Today

## ■ Procedures

- Stack Structure
- Calling Conventions
  - Passing control
  - Passing data
  - Managing local data
- Illustration of Recursion

# Stack-Based Languages

## ■ Languages that support recursion

- e.g., C, Pascal, Java
- Code must be “*Reentrant*”
  - Multiple simultaneous instantiations of single procedure
- Need some place to store state of each instantiation
  - Arguments
  - Local variables
  - Return pointer

## ■ Stack discipline

- State for given procedure needed for limited time
  - From when called to when return
- Callee returns before caller does

## ■ Stack allocated in *Frames*

- state for single procedure instantiation

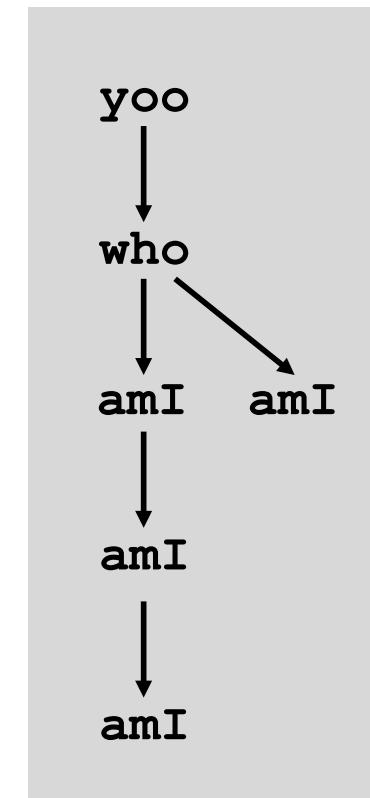

# Call Chain Example

```
yoo (...)  
{  
    •  
    •  
    who () ;  
    •  
    •  
}
```

```
who (...)  
{  
    • • •  
    amI () ;  
    • • •  
    amI () ;  
    • • •  
}
```

```
amI (...)  
{  
    •  
    •  
    amI () ;  
    •  
    •  
}
```

## Example Call Chain

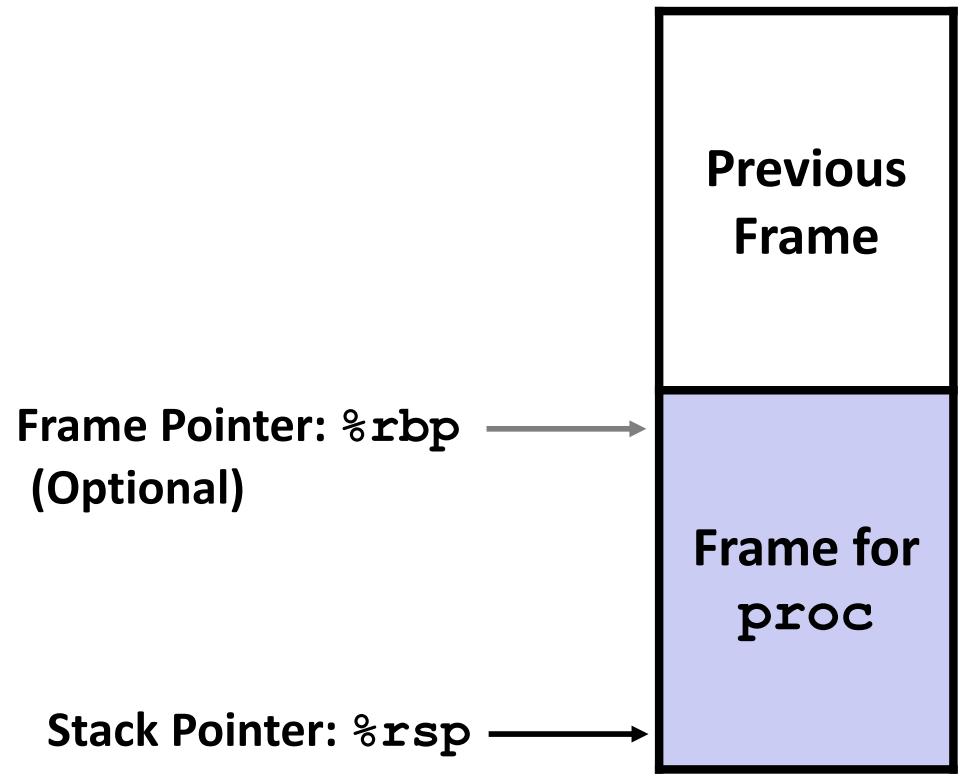

Procedure amI () is recursive

# Stack Frames

## ■ Contents

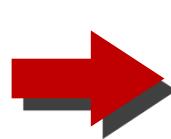

- Return information
- Local storage (if needed)
- Temporary space (if needed)

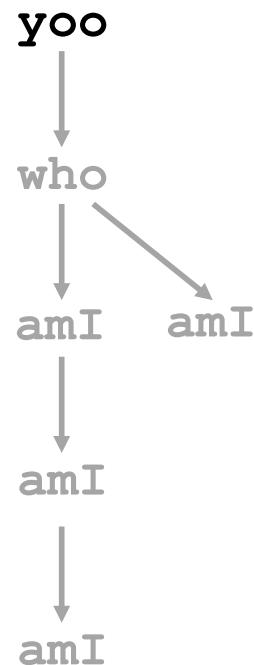

## ■ Management

- Space allocated when enter procedure
  - “Set-up” code
  - Includes push by **call** instruction
- Deallocated when return
  - “Finish” code
  - Includes pop by **ret** instruction

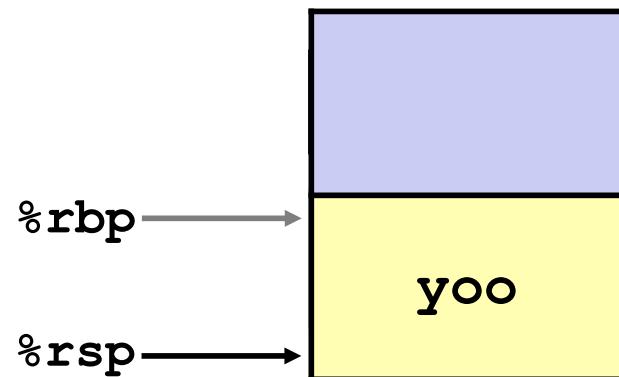

# Example

```
yoo (...)  
{  
    •  
    •  
    who ();  
    •  
    •  
}
```

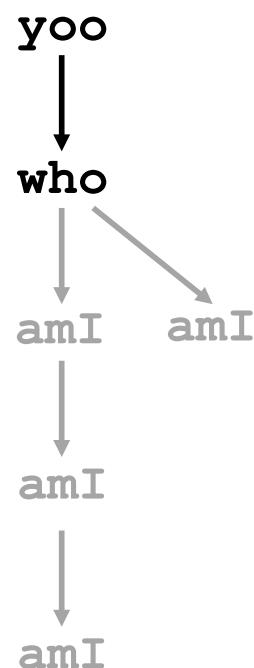

Stack

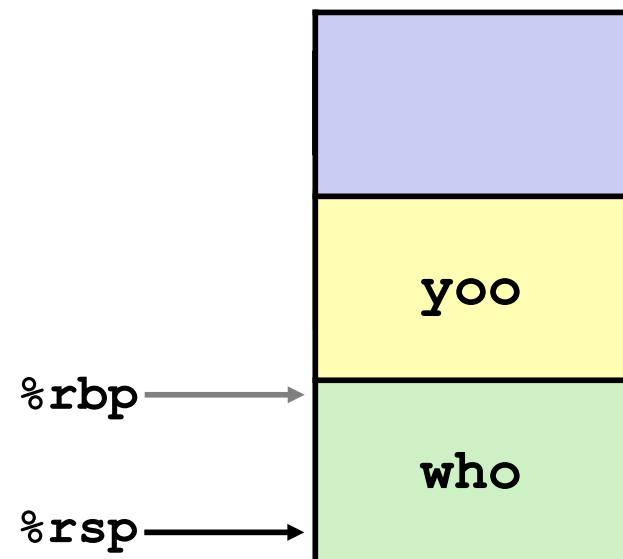

# Example

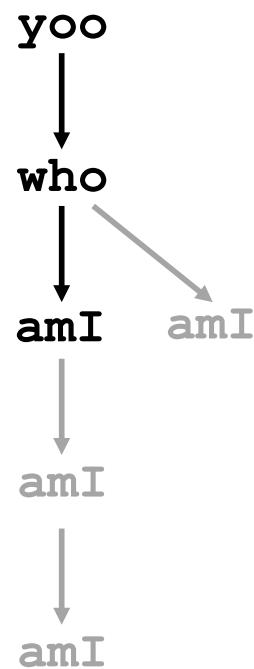

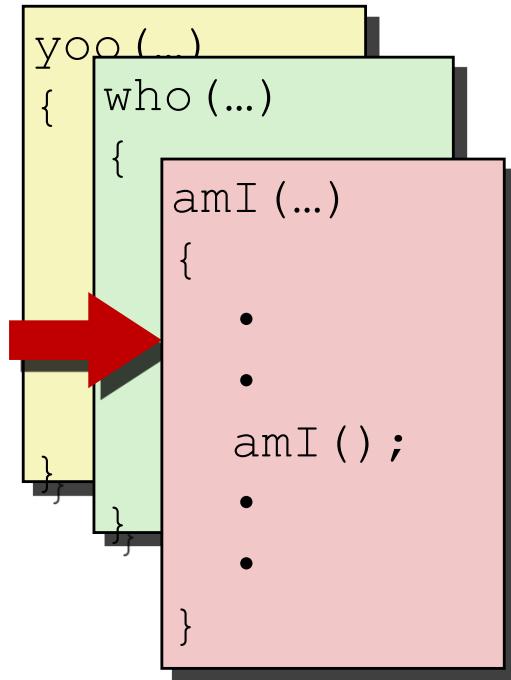

```
yoo(...)  
{   who(...)  
    {  
        . . .  
        amI();  
        . . .  
        amI();  
        . . .  
    }  
}
```

    •  
    •  
}  
}
```

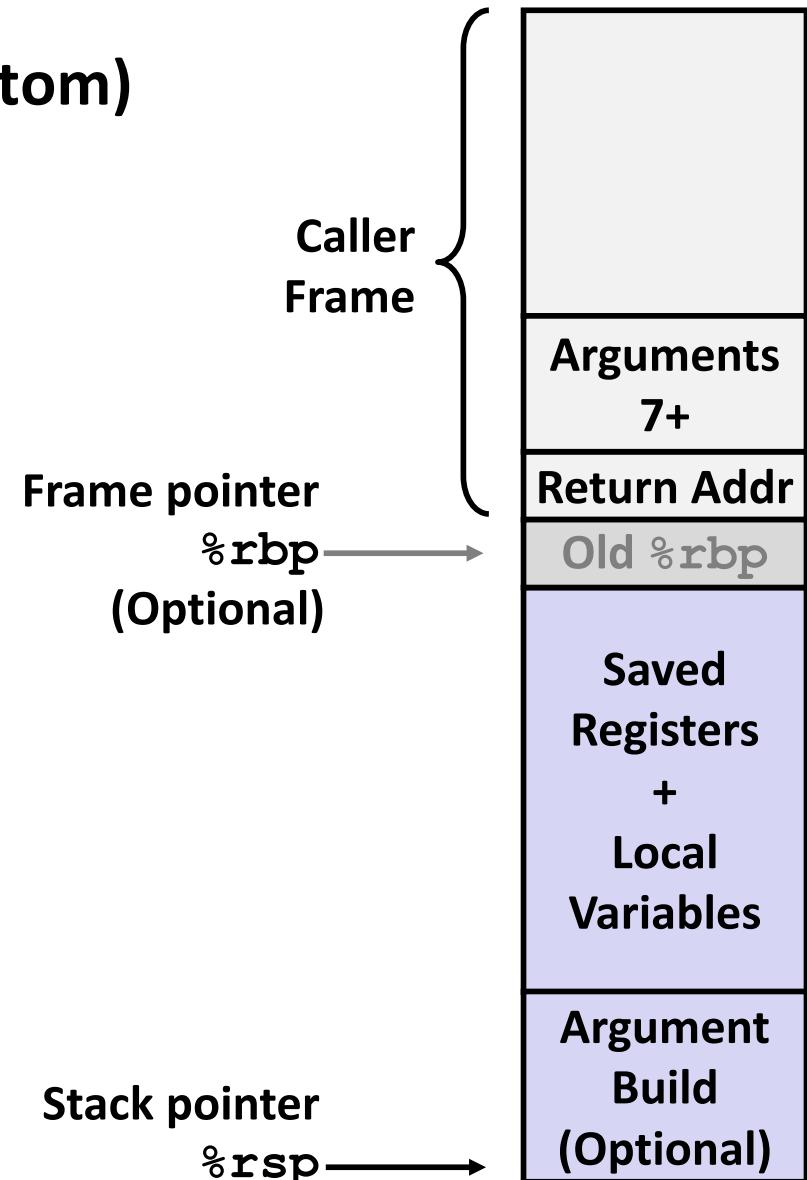

Stack

# x86-64/Linux Stack Frame

## ■ Current Stack Frame (“Top” to Bottom)

- “Argument build:”  
Parameters for function about to call
- Local variables  
If can’t keep in registers
- Saved register context
- Old frame pointer (optional)

## ■ Caller Stack Frame

- Return address
  - Pushed by `call` instruction
- Arguments for this call

# Example: incr

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

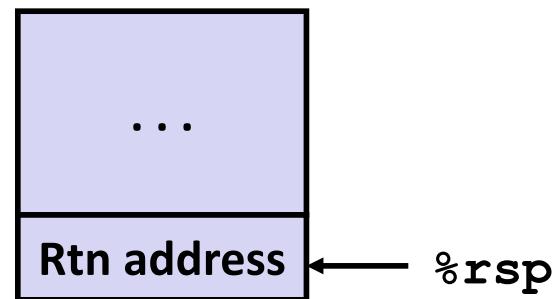

```
incr:  
    movq    (%rdi), %rax  
    addq    %rax, %rsi  
    movq    %rsi, (%rdi)  
    ret
```

Register	Use(s)
%rdi	Argument <b>p</b>
%rsi	Argument <b>val</b> , <b>y</b>
%rax	<b>x</b> , Return value

# Example: Calling `incr` #1

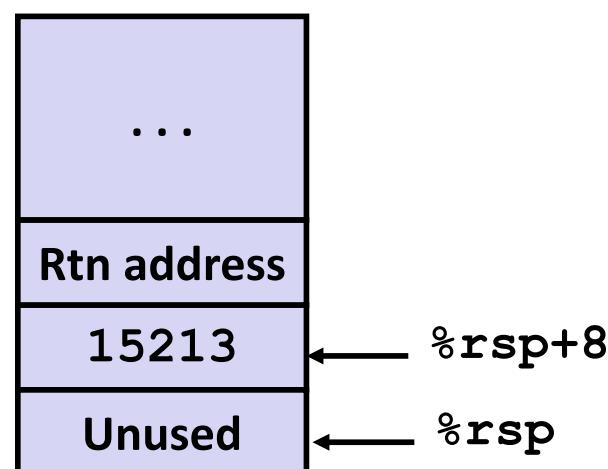

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Initial Stack Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Resulting Stack Structure

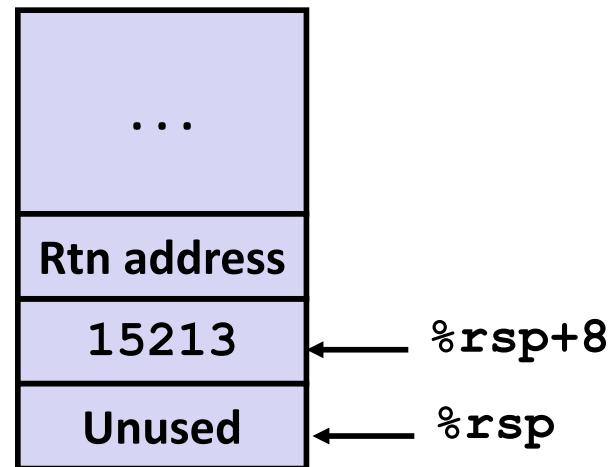

# Example: Calling `incr` #2

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Stack Structure

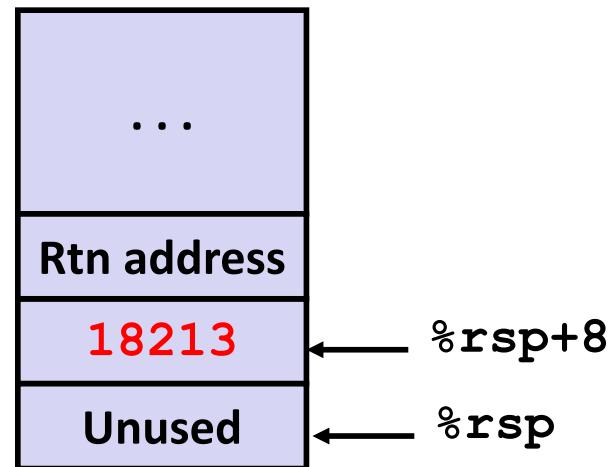

Register	Use(s)
%rdi	&v1
%rsi	3000

# Example: Calling `incr` #3

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Stack Structure

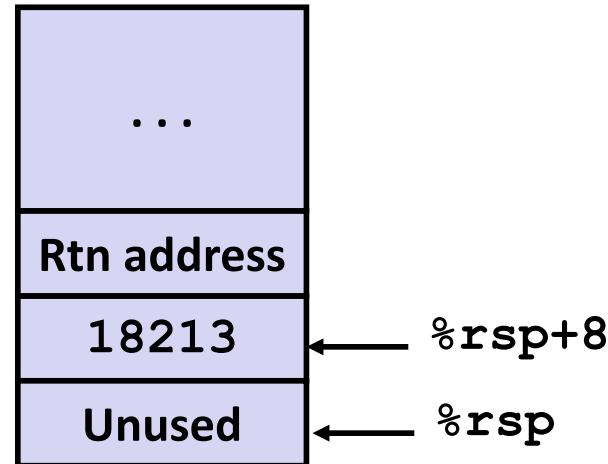

Register	Use(s)
%rdi	&v1
%rsi	3000

# Example: Calling `incr` #4

Stack Structure

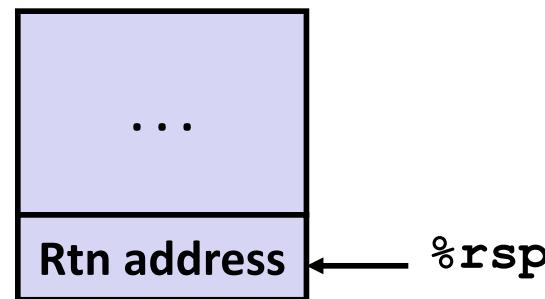

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rax	Return value

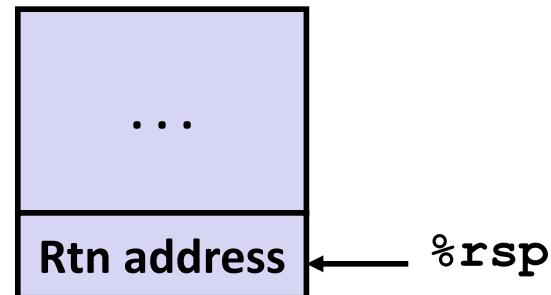

Updated Stack Structure

# Example: Calling `incr` #5

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

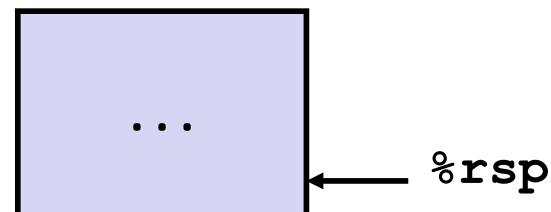

Updated Stack Structure

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Register	Use(s)
%rax	Return value

Final Stack Structure

# Register Saving Conventions

## ■ When procedure **yoo** calls **who**:

- **yoo** is the *caller*
- **who** is the *callee*

## ■ Can register be used for temporary storage?

```
yoo:
```

```
• • •  
    movq $15213, %rdx  
    call who  
    addq %rdx, %rax  
• • •  
    ret
```

```
who:
```

```
• • •  
    subq $18213, %rdx  
• • •  
    ret
```

- Contents of register **%rdx** overwritten by **who**
- This could be trouble → something should be done!
  - Need some coordination

# Register Saving Conventions

- When procedure **yoo** calls **who**:
  - **yoo** is the *caller*
  - **who** is the *callee*
- Can register be used for temporary storage?
- Conventions
  - ***“Caller Saved”***
    - Caller saves temporary values in its frame before the call
  - ***“Callee Saved”***
    - Callee saves temporary values in its frame before using
    - Callee restores them before returning to caller

# x86-64 Linux Register Usage #1

## ■ **%rax**

- Return value
- Also caller-saved
- Can be modified by procedure

## ■ **%rdi, ..., %r9**

- Arguments
- Also caller-saved
- Can be modified by procedure

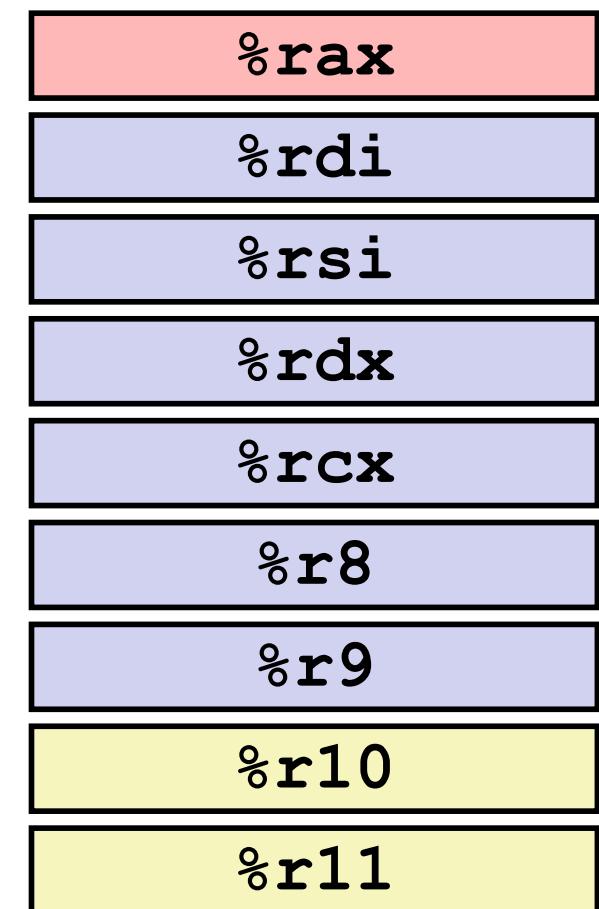

## ■ **%r10, %r11**

- Caller-saved
- Can be modified by procedure

Return value

Arguments

Caller-saved  
temporaries

# x86-64 Linux Register Usage #2

## ■ **%rbx, %r12, %r13, %r14**

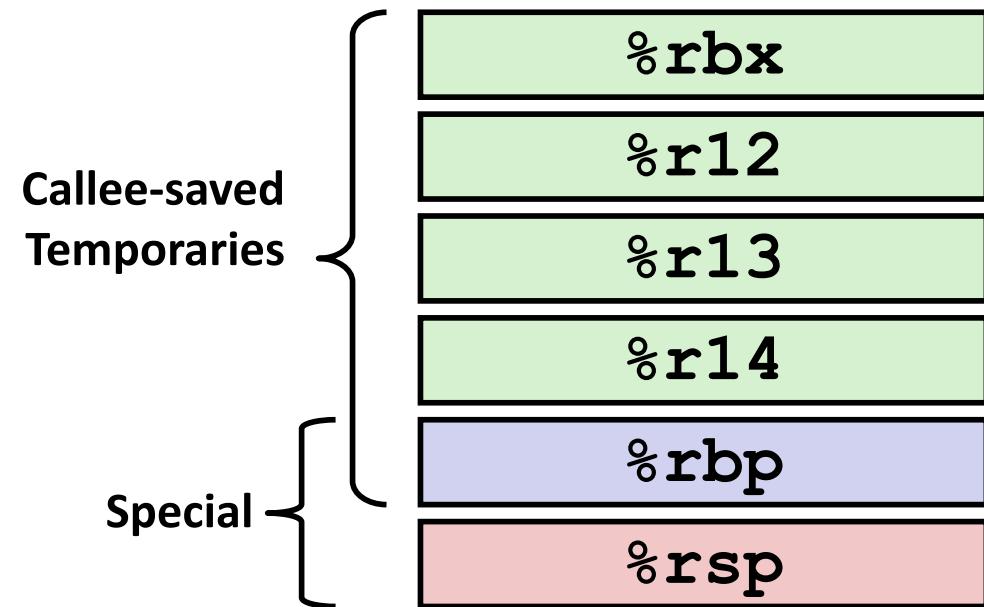

- Callee-saved
- Callee must save & restore

## ■ **%rbp**

- Callee-saved
- Callee must save & restore
- May be used as frame pointer
- Can mix & match

## ■ **%rsp**

- Special form of callee save
- Restored to original value upon exit from procedure

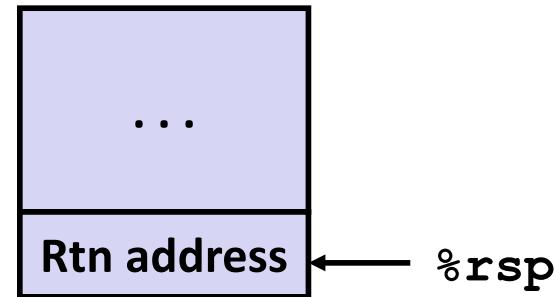

# Callee-Saved Example #1

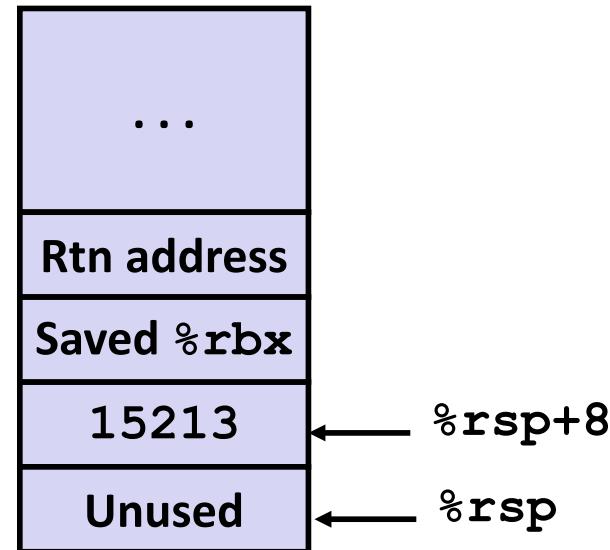

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq   $16, %rsp
    movq   %rdi, %rbx
    movq   $15213, 8(%rsp)
    movl   $3000, %esi
    leaq   8(%rsp), %rdi
    call   incr
    addq   %rbx, %rax
    addq   $16, %rsp
    popq   %rbx
    ret
```

Initial Stack Structure

Resulting Stack Structure

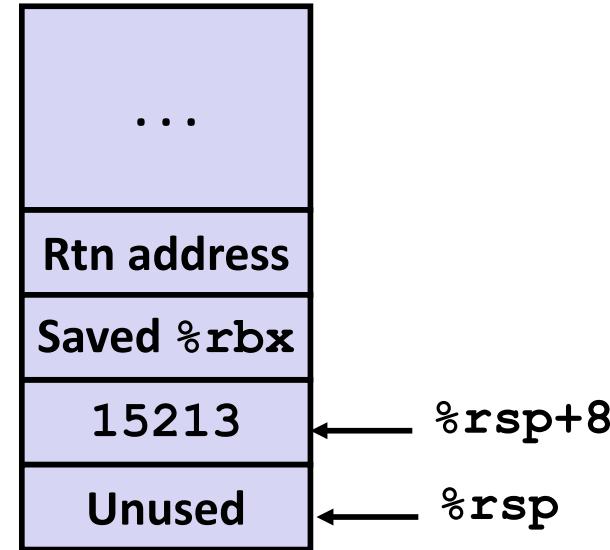

# Callee-Saved Example #2

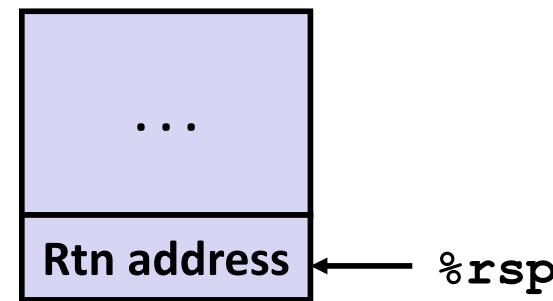

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call_incr2:
    pushq  %rbx
    subq   $16, %rsp
    movq   %rdi, %rbx
    movq   $15213, 8(%rsp)
    movl   $3000, %esi
    leaq   8(%rsp), %rdi
    call   incr
    addq   %rbx, %rax
    addq   $16, %rsp
    popq   %rbx
    ret
```

%rax	Return value	Return value

# Observations About Recursion

## ■ Handled Without Special Consideration

- Stack frames mean that each function call has private storage
  - Saved registers & local variables
  - Saved return pointer
- Register saving conventions prevent one function call from corrupting another's data
  - Unless the C code explicitly does so (e.g., buffer overflow in Lecture 9)
- Stack discipline follows call / return pattern
  - If P calls Q, then Q returns before P
  - Last-In, First-Out

## ■ Also works for mutual recursion

- P calls Q; Q calls P

# x86-64 Procedure Summary

## ■ Important Points

- Stack is the right data structure for procedure call / return
  - If P calls Q, then Q returns before P

## ■ Recursion (& mutual recursion) handled by normal calling conventions

- Can safely store values in local stack frame and in callee-saved registers
- Put function arguments at top of stack
- Result return in `%rax`

## ■ Pointers are addresses of values

- On stack or global
