Exil
The eigenvalues of A are 13 and D. First verify

$$A = A \cup$$

$$A \cup$$

$$A \cup$$

Ex 2
First use the inner product uses of matrix-matrix multiplication.
Let the columns of U be
$$V_{11} \dots V_n \in \mathbb{R}^n$$
, so that
 $V = E_{v_1}^{v_1} V_{v_1} \dots V_n$ al $V^T = \begin{bmatrix} -v_1^T - \\ -v_2^T - \\ \vdots \\ -v_n^T - \end{bmatrix}$

Since the columns of V are orthogonal.

$$V_i^T v_j^* = \begin{cases} \mathcal{O} & \text{if } i \neq j \\ v_i^T v_i^* & \text{if } i = j \end{cases}$$

Thus V is diagonal. By the above, the diagonal elements of
V are of the form $v_i^T v_i^* = ||v_i||^2$. Therefore $V^T V = I$
if $\mathcal{G} = ||v_i||^2 = 1$ for $i = 1, ..., n$, i.e., if the columns are
orthonormal.

Ex 3
A notion is symmetric if
$$A \circ A^{T}$$
. First lef $A \circ X^{T} \otimes A^{T} = (X^{T}X)^{T} = X^{T}(X^{T})^{T} = X^{T}X \circ A$
 $A^{T} = (X^{T}X)^{T} = X^{T}(X^{T})^{T} = X^{T}X \circ A$
Next lef $A = XX^{T}$. Then
 $A^{T} = (XX^{T})^{T} = (X^{T})^{T}X^{T} = XX^{T} = A$

$$Ex \ H$$

$$P = \begin{bmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} \implies P^{T} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix}^{T} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 0 \end{bmatrix}^{T} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 0 \end{bmatrix}^{T} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}^{T} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}^{T}$$

$$PP^{T} = \begin{bmatrix} 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}^{T} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}^{T}$$

$$So \ P^{T}P = PP^{T} = I, \text{ which is interesting to note.}$$

$$\begin{array}{c} \mathcal{E}_{X} \leq \\ \mathcal{V}^{T} \mathcal{V}^{2} \end{array} & \left[\begin{array}{c} \cos \Theta & \sin \Theta \\ -\eta \sin \Theta & \eta \cos \Theta \end{array} \right] \cos \Theta & \eta \cos \Theta \end{array} \right] \left[\begin{array}{c} \cos$$

$$= \begin{bmatrix} c_{0,1}^{2}\Theta + g_{1}n^{2}\Theta & -q g_{1}n\Theta c_{0}g\Theta + q g_{1}n\Theta c_{0}g\Theta \\ -q g_{1}n\Theta c_{0}g\Theta + q g_{1}n\Theta c_{0}g\Theta & q g_{1}^{2}(g_{1}n^{2}\Theta + c_{0}g^{2}\Theta) \end{bmatrix}$$

Note that cos20 + sh30 = 1. Further, since q e \$0,13, q2=1, so

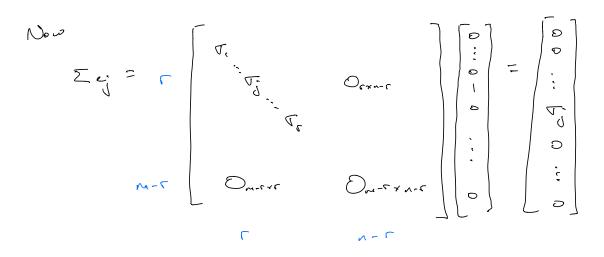

$$\mathcal{V}^{\tau}\mathcal{V}=\mathcal{I}.$$

Ex 6
We will commonly replace A with its SUD, i.e.,
$$A = U \ge V^T$$
.
 $A_{y} = A(v_{1}+v_{2}) = U \ge V^T(v_{1}+v_{2})$
 $= U \ge V^T v_{1} + U \ge U^T v_{2}$
 $= U \ge (V^T v_{1} + V^T v_{2})$
Now note that if v_{1} is the jth column of V, we have

$$\sqrt{\frac{V_{i}}{V_{2}}} = \begin{pmatrix} V_{i}^{T} \\ V_{2}^{T} \\ \vdots \\ V_{2}^{T} \\ \vdots \\ V_{1}^{T} \\ U \\ \vdots \\ V_{1}^{T} \\ \end{bmatrix}$$

$$v = \begin{cases} 0 \\ 0 \\ \vdots \\ 0 \\ \vdots \\ 0 \\ \vdots \\ 0 \\ \end{bmatrix} = e_{j} \qquad called the j th staded below the staded below to stade the staded below the staded bel$$

$$A_{y} = U \Sigma \left(V^{T} v_{1} + V^{T} v_{2} \right) = U \Sigma \left(e_{1} + e_{2} \right)$$

So that $U \ge e_j = \nabla_j u_j$ (write it and like above to see this) Therefore $A_j = \nabla_i u_i + \nabla_2 u_z$. Now note that $u_{1} \perp u_{2}$, so $||Ay||^{2} = ||\nabla_{1} u_{1} + \nabla_{2} u_{2}||^{2}$ $= \nabla_{1}^{2} ||u_{1}||^{2} + \nabla_{2}^{2} ||v_{2}||^{2} + 2\nabla_{1} \nabla_{2} u_{1}^{2} u_{2}$ $= \nabla_{1}^{2} + \nabla_{2}^{2}$ $= ||Ay|| = \sqrt{\nabla_{1}^{2} + \nabla_{2}^{2}}$

 $\frac{E_{x}}{S_{x}} \frac{7}{10}$ $S_{x} \frac{1}{10} \frac{1}{x} = \frac{1}{x}, \quad \text{i.e.}, \quad \left(A_{z}^{T}\right)^{T}\left(A_{x}^{T}\right) = 0. \quad \text{Expanding, we get}$ $\frac{T}{2} \frac{T}{4} \frac{1}{x} = \frac{1}{2} \frac{1}{x} \sqrt{2} \frac{1}{x} \sqrt{2} \sqrt{2} \sqrt{2}$ $= \frac{1}{2} \sqrt{2} \sqrt{2} \sqrt{2} \sqrt{2} \sqrt{2}$ $= \frac{1}{2} \sqrt{2} \sqrt{2} \sqrt{2} \sqrt{2} \sqrt{2} \sqrt{2}$

Therefore taking
$$z = v_1$$
 and $x = v_2$ gives
 $z^T A^T A x = (v_1^T V) (\Sigma^T \overline{z}) (V^T v_2)$

$$z e_i 2 2 e_z$$

 $= \overline{\tau_i \overline{\tau_2} e_i \overline{e_2}} = \overline{0}$ Since $e_i \overline{e_2} = [i \circ \cdots \circ] \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} = \overline{0}$. An easier way to Solve this is to recognize that $A\overline{\tau_{ij}} = \overline{\tau_j v_j}$ by the reasoning of the previous exercise. In this case

$$(\mathcal{A}^{\mathsf{T}}_{\mathcal{Z}})^{\mathsf{T}} (\mathcal{A}^{\mathsf{T}}_{\mathsf{X}}) = (\mathcal{T}_{\mathsf{T}} \cup_{\mathsf{T}})^{\mathsf{T}} (\mathcal{T}_{\mathsf{T}} \cup_{\mathsf{T}})$$
$$= \mathcal{T}_{\mathsf{T}} \mathcal{T}_{\mathsf{T}} \cup_{\mathsf{T}}^{\mathsf{T}} \cup_{\mathsf{T}} = 0$$
Schee all singular vectors are orthogonal.

Ex 8 See rotes.

Ex ? See notes. Ex 10 Write X as UEVT. Then we see that $A = X^T X = U \Sigma^T U^T U \Sigma V^T$ $= V \Sigma^T \Sigma V^T$ but $\Sigma^T \Sigma$ is diagonal and V is an orthogonal noteir, so $V (\Sigma^T \Sigma) V^T$ is a valid eigenducomposition. We three here Conclude that the eigenvectors of A are the right singular vectors of X and the eigenvalues are the squares of the Singular values of X.

What would happen it we let A=XX⁺?
