

Computing Beyond Silicon Summer School

Physics becomes the computer

Norm Margolus

Physics becomes the computer

Emulating Physics

- » *Finite-state, locality, invertibility, and conservation laws*

Physical Worlds

- » *Incorporating comp-universality at small and large scales*

Spatial Computers

- » *Architectures and algorithms for large-scale spatial computations*

Nature as Computer

- » *Physical concepts enter CS and computer concepts enter Physics*

Emulating Physics

- **Why emulate physics?**

- Computation models must adapt to microscopic physics
- Computation models may help us understand nature

- Rich dynamics

- Start with locality:
 - *Cellular Automata*

Conway's "Game of Life"

*256x256 region of a larger grid.
Glider gun inserted near middle.*

*In each 3x3 neighborhood,
count the ones, not including
the center:*

If total = 2: center unchanged

If total = 3: center becomes 1

Else: center becomes 0

Conway's "Game of Life"

*256x256 region of a larger grid.
About 1500 steps later.*

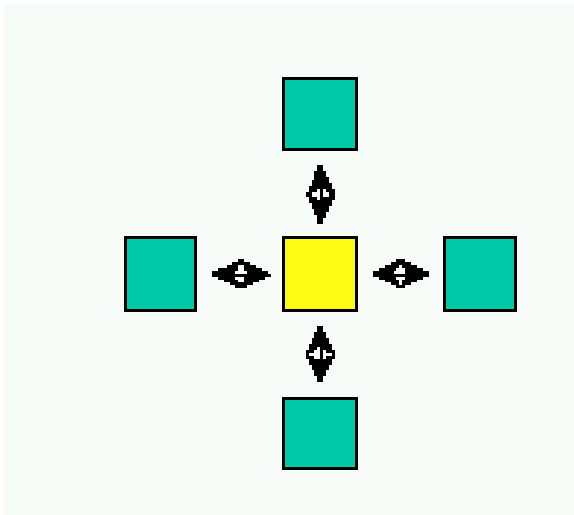

- Captures physical locality and finite-state

But,

- Not reversible (doesn't map well onto microscopic physics)
- No conservation laws (nothing like momentum or energy)
- No interesting large-scale behavior

Reversibility & other conservations

- Reversibility is conservation of information
- Why does exact conservation seem hard?

- The same information is visible at multiple positions
- For reversibility, **one n^{th}** of the neighbor information must be **left at the center**

Adding conservations

- With traditional CA's, conservations are a *non-local property* of the dynamics.
- **Simplest solution:** redefine CA's so that *conservation* is a *manifestly local* property
- CA = *regular computation in space & time*
 - » **Regular in space:** repeated structure
 - » **Regular in time:** repeated sequence of steps

Diffusion rule

Use 2x2 blockings. Use solid blocks on even time steps, use dotted blocks on odd steps.

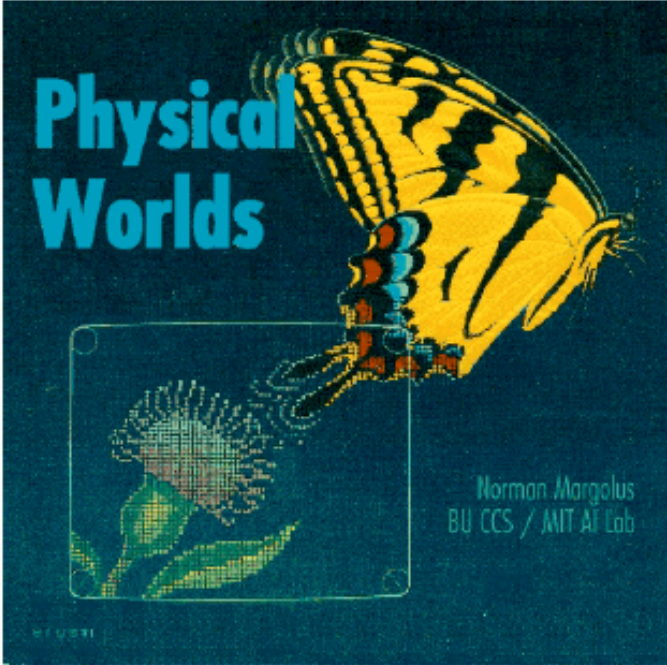

We “randomly” choose to rotate blocks 90-degrees cw or ccw (we actually use a fixed sequence of choices for each spot).

cw = clockwise

ccw = counter-clockwise

Diffusion rule

Physical Worlds

Norman Margolus
BU CCS / MIT AI Lab

Even steps: rotate cw or ccw

a	b
c	d

→

c	a
d	b

or

b	d
a	c

Odd steps: rotate cw or ccw

a	b
c	d

→

c	a
d	b

or

b	d
a	c

We “randomly” choose to rotate blocks 90-degrees cw or ccw (we actually use a fixed sequence of choices for each spot).

- Take this image as our working environment

Diffusion rule

We “randomly” choose to rotate blocks 90-degrees cw or ccw (we actually use a fixed sequence of choices for each spot).

... and this is what is created after some number of generations

TMM Gas rule

Use 2x2 blockings. Use solid blocks on even time steps, use dotted blocks on odd steps.

Even steps: *rotate cw*

Odd steps: *rotate ccw*

Except: *2 ones on diag, nc*

- TM = Toffoli/Margolus

TM Gas rule

Even step: update *solid* blocks.

Even steps: *rotate cw*

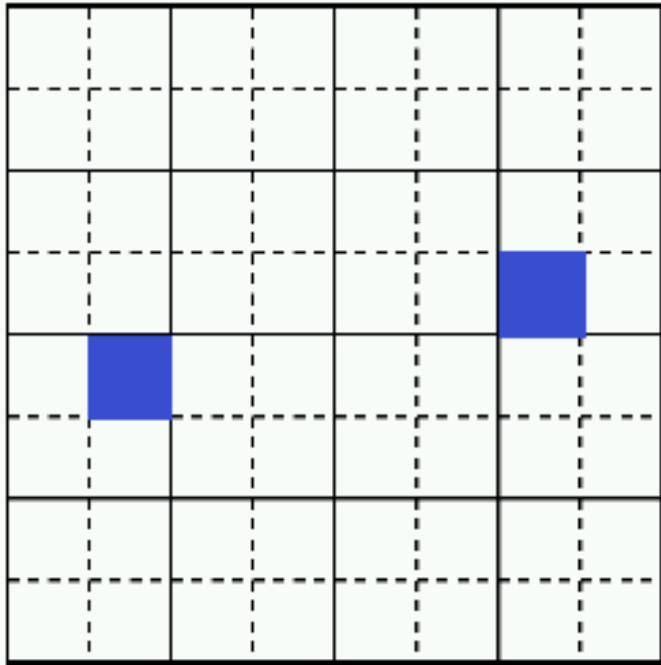

Odd steps: *rotate ccw*

Except: *2 ones on diag, nc*

TM Gas rule

Odd step: update *dotted* blocks

Even steps: *rotate cw*

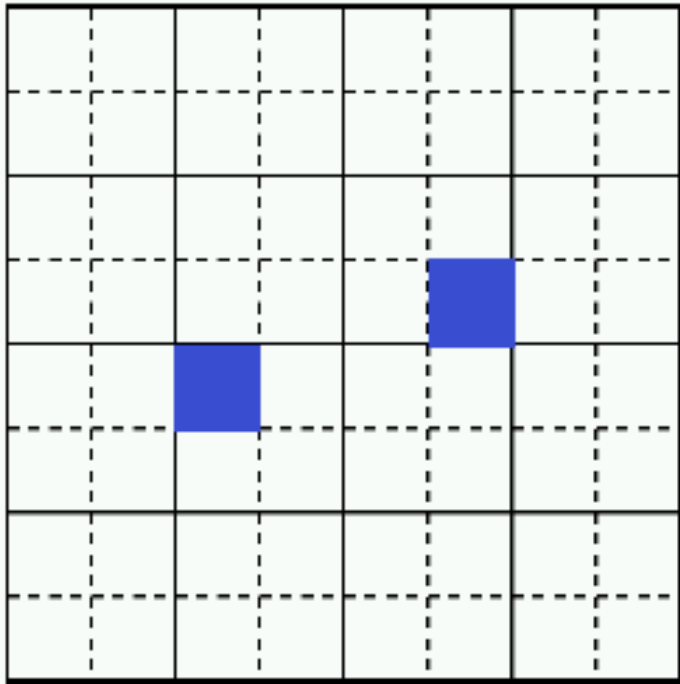

Odd steps: *rotate ccw*

Except: *2 ones on diag, nc*

TM Gas rule

Even step: update *solid* blocks

Except: 2 ones on diag, *nc*

TM Gas rule

Odd step: update *dotted* blocks

Even steps:

rotate cw

Odd steps:

rotate ccw

Except: 2 ones on diag, *nc*

TM Gas rule

Even step: update *solid* blocks

Even steps: *rotate cw*

Odd steps: *rotate ccw*

Except: 2 ones on diag, *nc*

TM Gas rule

Odd step: update *dotted* blocks

Even steps: *rotate cw*

Odd steps: *rotate ccw*

Except: 2 ones on diag, *nc*

TM Gas rule

Even steps: *rotate cw*

Odd steps: *rotate ccw*

Except: *2 ones on diag, no*

Now we analyze how it works on a larger example and for more generations

TM Gas rule

Even steps:

rotate cw

Odd steps:

rotate ccw

Except: 2 ones on diag, nc

TM Gas rule

TM Gas rule

Lattice gas refraction

- Half the time: HPP gas rule everywhere:

Even & odd: swap along diags

Except: two ones on diag flip

- Half the time: HPP gas rule outside of blue region, *ID rule* inside (no change).

Lattice gas hydrodynamics

Six direction LGA flow past a half-cylinder, with vortex shedding. System is $2K \times 1K$.

Dynamical Ising rule

Gold/silver checkerboard

We divide the space into two sublattices, updating the gold on even steps, silver on odd.

Even steps: update gold sublattice

Odd steps: update silver sublattice

A spin is flipped if exactly 2 of its 4 neighbors are parallel to it.

After the flip, exactly 2 neighbors are still parallel.

Dynamical Ising rule

Even steps: update gold sublattice

Odd steps: update silver sublattice

A spin is flipped if exactly 2 of its 4 neighbors are parallel to it. After the flip, exactly 2 neighbors are still parallel.

Dynamical Ising rule

Even steps: update gold sublattice

Odd steps: update silver sublattice

A spin is flipped if exactly 2 of its 4 neighbors are parallel to it. After the flip, exactly 2 neighbors are still parallel.

Question: What will be the state in 100 generations, if the picture above is the initial state? What in 10,000 generations?

Bennett's 1D rule

Gold/silver 1D lattice

- *At each site in a 1D space, we put 2 bits of state.*
- *We'll call one the "gold" bit and one the "silver" bit.*
- *We update the gold bits on even steps, and the silver on odd steps.*

Even steps: update gold sublattice

Odd steps: update silver sublattice

- *A spin is flipped if exactly 2 of its 4 neighbors are parallel to it.*
- *After the flip, exactly 2 neighbors are still parallel.*

Bennett's 1D rule

Bennett's rules creation: 2D picture from 1D rules

Bennett's rules:

Even steps: update gold sublattice

Odd steps: update silver sublattice

A spin is flipped if exactly 2 of its 4 neighbors are parallel to it. After the flip, exactly 2 neighbors are still parallel.

3D Ising with heat bath

If the heat bath is initially much cooler than the spin system, then domains grow as the spins cool.

2D “Same” rule

Gold/silver checkerboard

Even steps: update gold sublattice

Odd steps: update silver sublattice

- We divide the space into two sublattices, updating the gold on even steps, silver on odd.

- A spin is flipped if all 4 of its neighbors are the same.
- Otherwise it is left unchanged.

2D “Same” rule

Even steps: update gold sublattice

Odd steps: update silver sublattice

A spin is flipped if all 4 of its neighbors are the same. Otherwise it is left unchanged.

2D “Same” rule

Even steps: update gold sublattice

Odd steps: update silver sublattice

A spin is flipped if all 4 of its neighbors are the same. Otherwise it is left unchanged.

3D “Same” rule

Reversible aggregation rule

Gold/silver checkerboard

Even steps: update gold sublattice

Odd steps: update silver sublattice

- We *update* the gold sublattice, then let gas and heat diffuse, then *update* silver and diffuse.

- When a gas particle diffuses next to *exactly one crystal particle*, it *crystallizes* and emits a heat particle.
- The reverse also happens.

for more info, see [cond-mat/9810258](https://arxiv.org/abs/cond-mat/9810258)

Reversible aggregation rule

Even steps: update gold sublattice

Odd steps: update silver sublattice

Adding forces irreversibly

becomes:

Particles six sites apart along the lattice attract each other.

3D momentum conserving crystallization.

Adding forces irreversibly

Crystallization using irreversible forces (Jeff Yepez, AFOSR)

Conservations summary

- To make **conservations manifest**, we employ a **sequence of steps**, in each of which either
 - 1. the data are *rearranged without any interaction*, or
 - 2. the data are *partitioned into disjoint groups of bits that change as a unit*.
- *Data that affect more than one such group don't change.*
- Conservations allow computations to **map efficiently onto microscopic physics**, and also allow them to have **interesting macroscopic behavior**.
