

# CFL Big Picture

# Context Free Languages Conclusion

- We have studied the class of context free languages (CFL)
- We saw two different ways to express a CFL
  1. Context Free Grammar
  2. Push Down Automata
- We showed that some were equally expressive
  - We need non-deterministic PDA to express Context Free Grammars
  - Recall the construction of the PDA had only one state, and possible several transitions on the same Non-terminal.
- Some were easier to use than others to describe some languages

# Acceptance

- Context free grammars

The *language of the CFG*,  $G$ , is the set

$$L(G) = \{w \in T^* \mid S \Rightarrow^* w\} \quad \text{where}$$

$S$  is the start symbol of  $G$

$\Rightarrow$  is the single step relation between derivations

- Push down automata

- Use of instantaneous descriptions (IDs) and the relation  $\vdash$  between IDs
- Acceptance by final state
- Acceptance by empty stack

# Algorithms

- We studied algorithms to transform one description into another
  1. Context Free Grammar to PDA (Theorem 2.21 pg 115)
  2. PDA into Context Free Grammar (Lemma 2.27 pg 119)
- We studied how to transform grammars
  1. To remove ambiguity (layering)
    1. Non-ambiguous languages can have ambiguous grammars
  2. To transform into Chomsky Normal Form

# Properties

- We saw that **Regular Languages** have many properties
- Closure properties
  - Union
  - Kleene – star
  - Intersection
  - Complement
  - Reversal
  - Difference
  - Prefix

# CFL Languages have fewer properties

- Closure properties
  - Union
  - Kleene – star
  - Concat
- But we do have the intersection between CFL and RL produces a CFL

# Closure Properties of CFL's

- The class of context-free languages is closed under these three operations: Union, Concatenation, Kleene Star
- Assumptions:
- Let  $G_1=(V_1,T_1,P_1,S_1)$  and  $G_2=(V_2,T_2,P_2,S_2)$
- be two CF grammars. Assume the sets of variables,  $V_1$  and  $V_2$  are disjoint.

# Union

n

- A grammar for the union  $L(G_1) \cup L(G_2)$  is
- $G = (\{S\} \cup V_1 \cup V_2, T_1 \cup T_2, P, S)$
- where  $P$  consists of productions in  $P_1$  and  $P_2$  together with  $S \rightarrow S_1 \mid S_2$

# Concatenatio

n

- A grammar for the concatenation  $L(G_1)L(G_2)$  is
- $G = (\{S\} \cup V_1 \cup V_2, T_1 \cup T_2, P, S)$
- where  $P$  consists of productions in
- $P_1$  and  $P_2$  together with  $S \rightarrow S_1S_2$ .

# Kleene Star

- A grammar for  $L(G_1)^*$  is
- $G = (\{S\} \cup V_1, T_1, P, S)$
- where  $P$  consists of productions in  $P_1$  together with  $S \rightarrow \Lambda \mid SS_1$
- qed

## Negative result for Complement, Intersection

- The class of context-free languages is *not* closed under these two operations: Complement, Intersection
- **Proof.** The language
- $L_1 = \{a^i b^j c^k \mid i, j \geq 0\} = \{a^i b^i \mid i \geq 0\} \bullet c^*$
- being the concatenation of two CFL's is CFL itself.
- Similarly,  $L_2 = \{a^j b^i c^i \mid i, j \geq 0\}$  is a CFL.
- However,  $L_1 \cap L_2 = \{a^i b^i c^i \mid i \geq 0\}$  is not a CFL, as we saw last time.
- Since the intersection can be expressed in terms of union and complementation  $A \cap B = \text{Comp}(\text{Comp}(A) \cup \text{Comp}(B))$ , it follows that the class of CFL's is not closed under complementation.

# Mixtures of CFL and RE

- **Theorem.** Intersection of any context-free language with any regular language is context-free.
- *Proof Idea.* Product construction. Take a PDA for the first language and a DFA for the second. Construct a PDA for the intersection by taking for its states the set of all pairs of states of the first two automata. Etc.
- qed
- Note that there is no sensible definition of the product of two PDA's: we cannot combine two stacks into one.

# Proving some language is not CF

- Pumping lemma for CF languages
- Let  $L$  be a CFL. Then there exists a number  $n$  (depending on  $L$ ) such that every string  $w$  in  $L$  of length greater than  $n$  contains a CFL pump.

# Context Free Pump

- A *CFL pump* consists of two non-overlapping substrings that can be pumped simultaneously while staying in the language.
- Precisely, two substrings  $u$  and  $v$  constitute a CFL pump for a string  $w$  of  $L$  ( $|w| > m$ ) when
  1.  $uv \neq \Lambda$  (which means that at least one of  $u$  or  $v$  is not empty)
  2. And we can write  $w = xuyvz$ , so that for every  $i \geq 0$
  3.  $xu^i y v^i z \in L$

# The Regular World

```
data DFA q s =
  DFA { states :: [q],
        symbols :: [s],
        delta :: q -> s -> q,
        start :: q,
        final :: [q] }
```

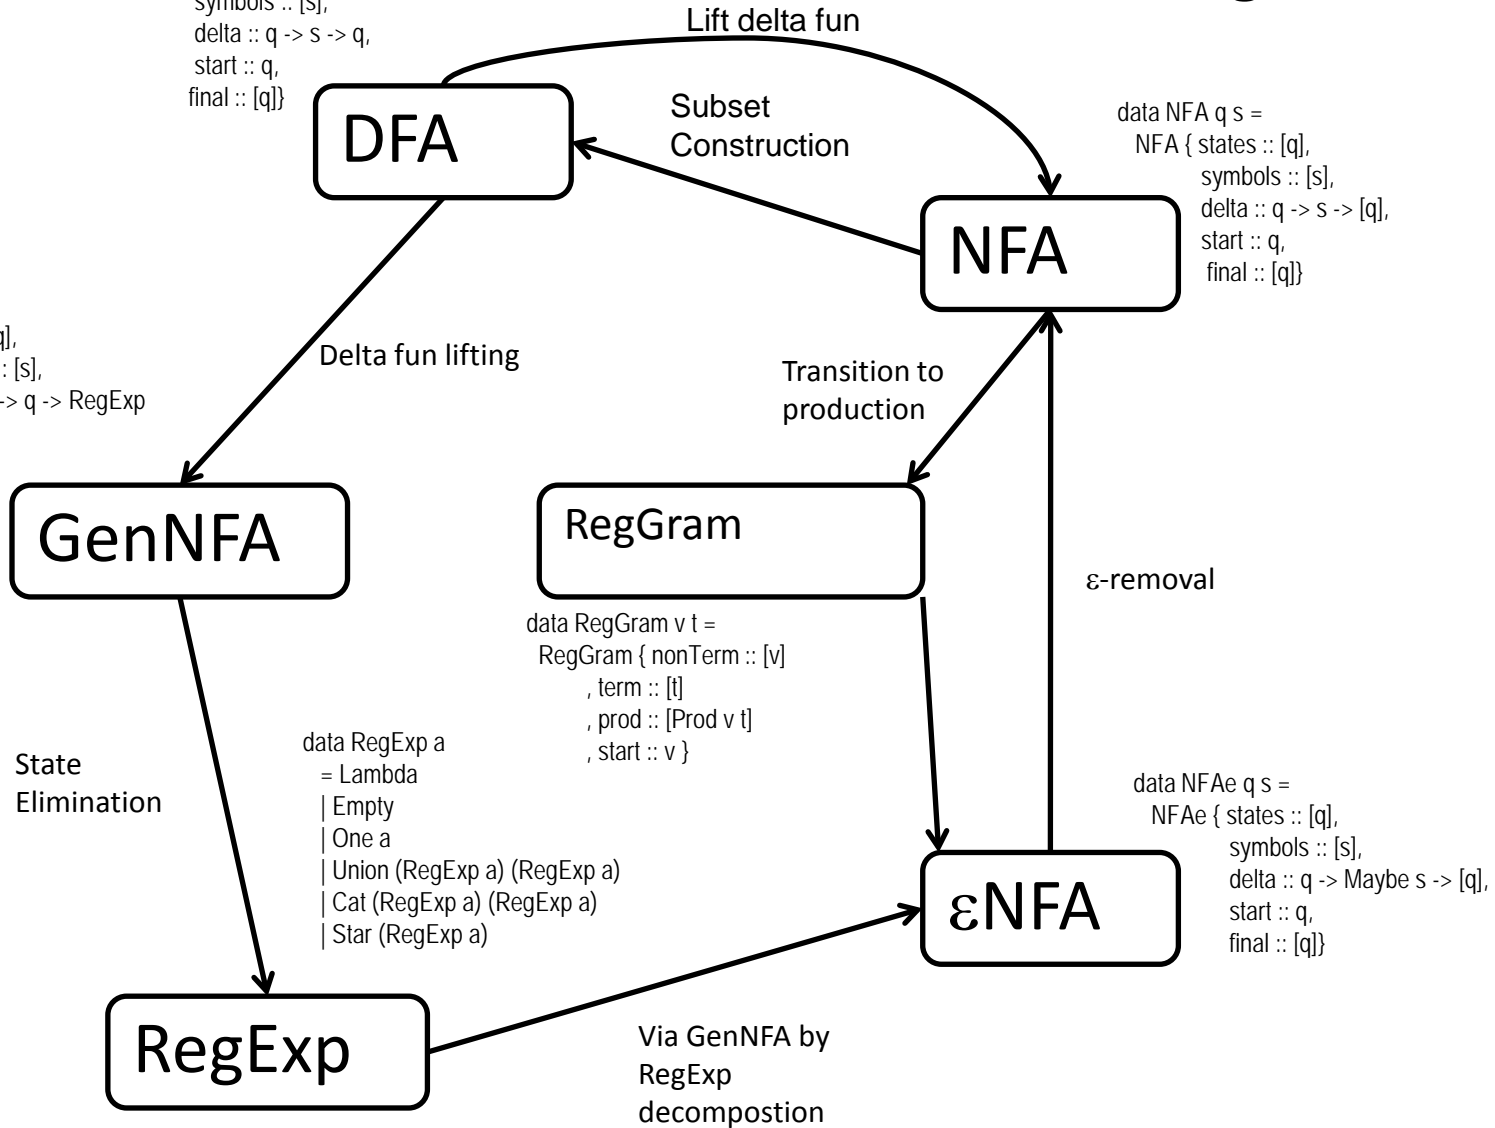

```
data NFA q s =
  NFA { states :: [q],
        symbols :: [s],
        delta :: q -> s -> [q],
        start :: q,
        final :: [q] }
```

```
data GNFA q s =
  GNFA { states :: [q],
         symbols :: [s],
         delta :: q -> q -> RegExp,
         start :: q,
         final :: [q] }
```

```
data RegGram v t =
  RegGram { nonTerm :: [v],
            term :: [t],
            prod :: [Prod v t],
            start :: v }
```

```
data RegExp a =
  Lambda
  | Empty
  | One a
  | Union (RegExp a) (RegExp a)
  | Cat (RegExp a) (RegExp a)
  | Star (RegExp a)
```

```
data NFAs q s =
  NFAs { states :: [q],
         symbols :: [s],
         delta :: q -> Maybe s -> [q],
         start :: q,
         final :: [q] }
```
