

In Class Exercises

- What kind of finite state automata is this
 - DFA
 - NFA
 - GNFA

- Is the NFA on the right, the Kleene closure of the NFA on the left?

- Does this DFA accept the empty language?

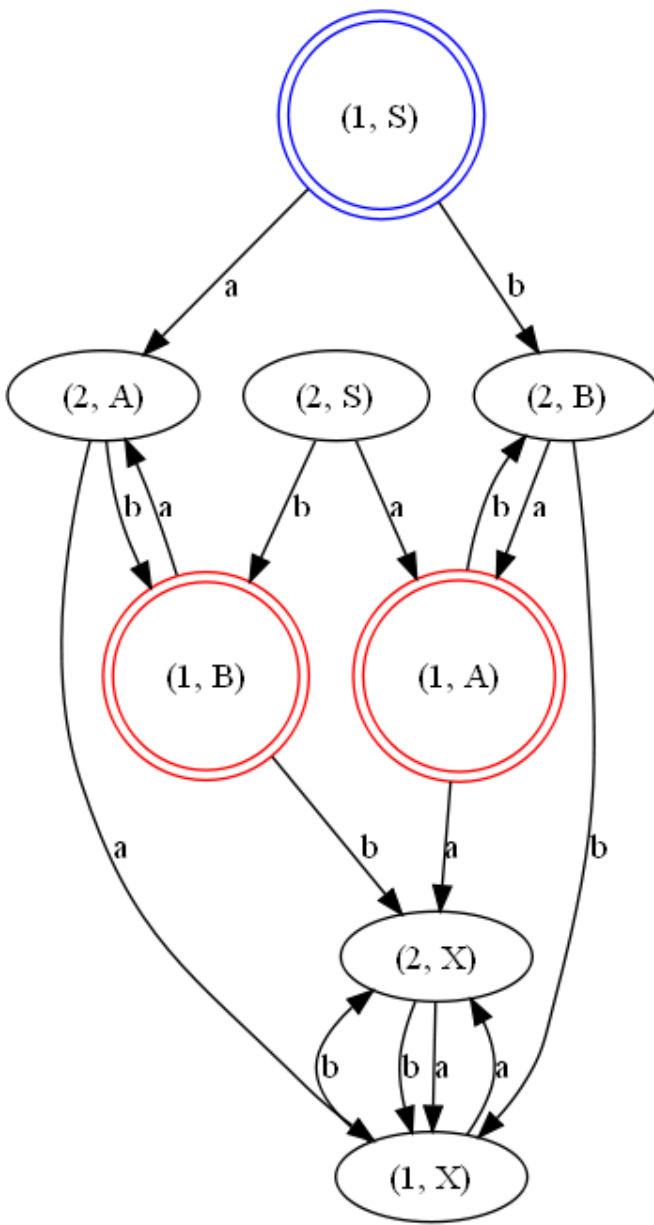

- Is the following language Context Free?
- $\{ x^i y^j z^k \mid i, j, k \geq 0, \text{ and } i + j = k \}$

- Construct a DFA that accepts the same language as the ϵ -NFA below

- Construct a DFA that accepts even length strings of where n two adjacent characters are the same, over the alphabet {a,b}.
 1. First construct a DFA for even length strings
 2. Then construct a DFA for no adjacent same characters
 3. Then combine them using the correct algorithm for the right closure property of DFAs

- Convert the CFG below into a PDA
 - It is acceptable to use a PDA that pushes strings of symbols, rather than single symbols on to the stack
